SCHC C/D
& F/R

3 deliverables in one draft

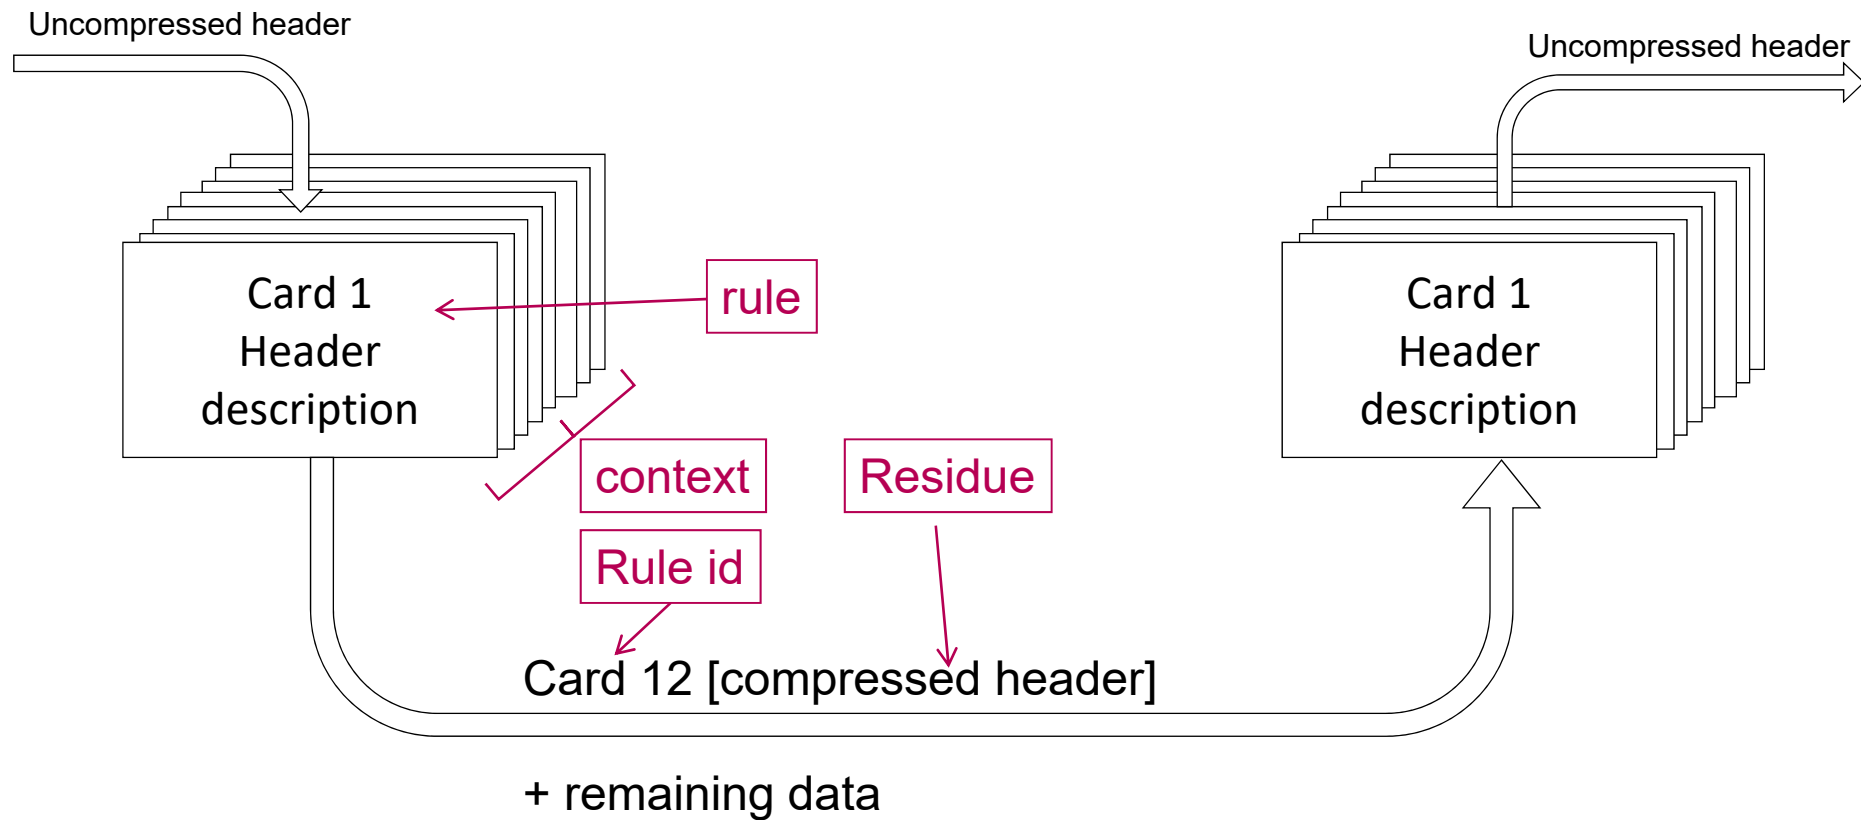

- Spec. of a Header Compression engine (**Section 7**)
 - Generic engine, uses Static Context (→ SCHC)
- Specification of a fragmentation protocol (**Section 8**)
 - Has 3 different “modes” described in this draft
 - The different modes address different requirements
- Spec. of simple UDP/IPv6 compression (**Section 10**)
 - Using this SCHC engine

Other related drafts

- Canonical representation of context
- Apply SCHC compression to upper-layer protocols
 - For example, CoAP/UDP/IPv6
- Apply SCHC fragmentation to underlying networks
 - For example, Sigfox, LoRaWAN[®]

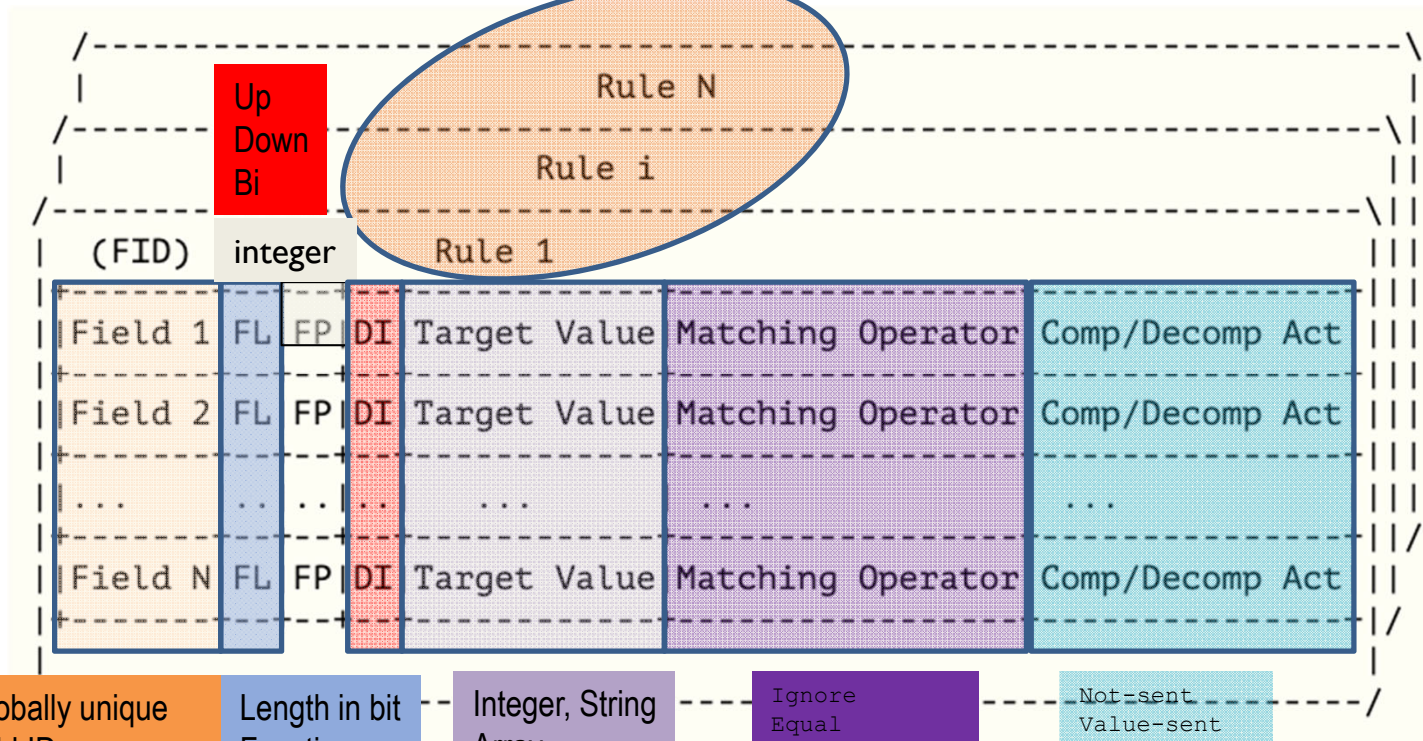

ruleID => value/length

Fragmentation

Compression

Globally unique field ID:
IPv6.version

Length in bit
Function

Integer, String
Array

Ignore
Equal
MSB (x)
Match-mapping

Not-sent
Value-sent
LSB
Mapping-sent
Route-*

6lo and SCHC

- Context
 - 6lo: no state for C/D, rules are known by construction
 - SCHC: no state for C/D, rules must be known by both ends (called context)

6lo and SCHC

- Bitmap and Rule ID:
 - 6lo: A fixed size bitmap gives the compression behavior and residues
 - SCHC: The rule ID has no semantic, its size is variable
 - more frequent compression schemes may have smaller sizes

6lo and SCHC

- Compression / Decompression functions:
 - Both: Send/Elided/Mapping/Compute
 - SCHC: MSB/LSB, (+extensible)
- C/D Behavior:
 - 6lo: fixed in the RFC
 - SCHC: Rules define the behavior.

SCHC in meshed 6lo ?

- SCHC offers a generic field description tool:
 - Size, position, direction,
 - An extendable compression/decompression mechanism.
- 6lo and SCHC are complementary solutions
 - It is time to look at them together.
