Using Netconf Pub/Sub Model for RATS Interaction Procedure

https://datatracker.ietf.org/doc/draft-xia-rats-pubsub-model/

Liang Xia Huawei

Wei Pan Huawei

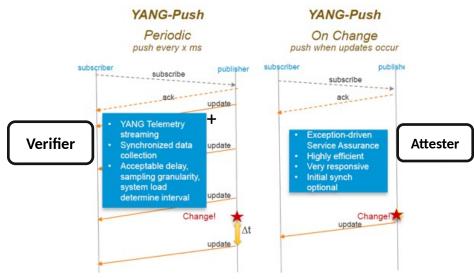

IETF 106 Singapore

Interaction Mode: Challenge & Response vs YANG pub sub & push

Classical mode: Challenge<->Response

draft-birkholz-rats-reference-interaction-model

Another mode: Publish<->Subscription & push
RFC 8639, RFC 8640, RFC8641

Suitable use cases: **on-demand RA**, 1:1 relationship, small or medium network...

Suitable use cases: **on-change RA**, 1:N or N:M relationship, medium or large network...

The inherited benefits of yang pub sub & push: flexibility, efficiency, scalability, filtering capability...

RATS YANG pub sub & push model Key Points

Subscription

[Attester]

```
<--Sub(nonce,authSecID,assertionSelection, event/period)
collectAssertions(assertionSelection)
     => assertions
signAttestationEvidence(authSecID, assertions, nonce)
     => signedAttestationEvidence
     signedAttestationEvidence -----
     verifyAttestationEvidence(signedAttestationEvidence, refAssertions)
                                             attestationResult <=
collectAssertions(assertionSelection)
     => assertions
signAttestationEvidence(authSecID, assertions, nonce)
     => signedAttestationEvidence
     signedAttestationEvidence ------>
     verifyAttestationEvidence(signedAttestationEvidence, refAssertions)
                                             attestationResult <=
    on-change/event happens
collectAssertions(assertionSelection)
     => assertions
signAttestationEvidence(authSecID, assertions, nonce)
     => signedAttestationEvidence
     signedAttestationEvidence ------
     verifyAttestationEvidence(signedAttestationEvidence, refAssertions)
                                             attestationResult <=
```

Event stream = integrity evidence

[Verifier]

Configure subscription or Dynamic subscription are both available

Selection Filters: filter the integrity evidence based on the condition as when, where, ...

RATS YANG pub sub & push model Key Points

```
[Attester]
                                                           [Verifier]
     <--Sub (nonce, authSecID, assertionSelection, event/period)
collectAssertions(assertionSelection)
     => assertions
signAttestationEvidence(authSecID, assertions, nonce)
     => signedAttestationEvidence
     signedAttestationEvidence ----->
     verifyAttestationEvidence(signedAttestationEvidence, refAssertions)
                                           attestationResult <=
collectAssertions(assertionSelection)
     => assertions
signAttestationEvidence(authSecID, assertions, nonce)
     => signedAttestationEvidence
     signedAttestationEvidence ---->
     verifyAttestationEvidence(signedAttestationEvidence, refAssertions)
    on-change/event happens
collectAssertions(assertionSelection)
     => assertions
signAttestationEvidence(authSecID, assertions, nonce)
     => signedAttestationEvidence
     signedAttestationEvidence -------
     verifyAttestationEvidence(signedAttestationEvidence, refAssertions)
                                           attestationResult <=
```

Periodic push

Periodic subscription: general and non-critical information collection

RATS YANG pub sub & push model Key Points

```
[Attester]
                                                              [Verifier]
     <--Sub (nonce, authSecID, assertionSelection, event/period)
collectAssertions(assertionSelection)
     => assertions
signAttestationEvidence(authSecID, assertions, nonce)
     => signedAttestationEvidence
     signedAttestationEvidence ------
     verifyAttestationEvidence(signedAttestationEvidence, refAssertions)
                                             attestationResult <=
collectAssertions(assertionSelection)
     => assertions
signAttestationEvidence(authSecID, assertions, nonce)
     => signedAttestationEvidence
     signedAttestationEvidence ------
     verifyAttestationEvidence(signedAttestationEvidence, refAssertions)
                                             attestationResult <=
```

On-change push or event-triggered push

On-change subscription: monitor the critical integrity evidence when change happens

Update trigger can be pre-defined events [I-D.bryskin-netconf-automation-yang]

Remote Attestation Subscription Parameters Handling

- The RA subscription parameters are:
 - To enable the dynamic negotiation with the attester about what information the verifier nee ds and how to construct them together.
 - Originating from the RA challenge parameters.
- Generally, most of the parameters carried in the subscription message won't change during the RA procedure, like:
 - Hash signature algorithm,
 - TPM name,
 - etc.
- Nonce is for freshness validation, and a little complicated:
 - Ensure that the nonce carried in every notification message is different, and both the atteste r and the verifier know the correct value in advance.
 - Possible solutions: the timestamp or counter, the same original seed and running same RNG function at both sides, RATS TUDA mechanism [I-D.birkholz-rats-tuda].

Some Examples: Configure subscription with on-change update trigger

```
<edit-config>
    <subscriptions
          xmlns="urn:ietf:params:xml:ns:yang:ietf-subscribed-notifications">
       <subscription>
           <id>100</id>
           <stream>pcr-trust-evidence</stream>
           <stream-subtree-filter>
               <xxx-vendor-device</pre>
                     xmlns="urn:xxx:params:xml:ns:yang:xxx-vendor-device ">
                                                                                         Selection Filters
                   <device-id>xxxxxxxxxxx/device-id>
               </xxx-vendor-device>
           </stream-subtree-filter>
           <pcr-list>
               <pcr>>
                   <pcr-indices>1</pcr-indices>
                   <pcr-indices>3</pcr-indices>
                   <pcr-indices>7</pcr-indices>
                   <hash-algo>
                       <tcg-hash-algo-id>TPM ALG SHA256</tcg-hash-algo-id>
                   </hash-algo>
                                                                                         Subscription Parameters
               </pcr>
           </pcr-list>
           <nonce-value>0x564ac291</nonce-value>
           <TPM ALG ID-value>TPM ALG ECDSA</TPM ALG ID-value>
           <pub-key-id>0x784a22bf</pub-key-id>
           <tpms>
               <tpm-name>tpm1</tpm-name>
           </tpms>
           <yp:on-change>
               <yp:dampening-period>100/yp:dampening-period>
                                                                                         Update Trigger
           </yp:on-change>
       </subscription>
    </subscriptions>
</edit-config>
```

Some Examples: Dynamic subscription with periodic update trigger

```
<rpc netconf:message-id="101"</pre>
      xmlns:netconf="urn:ietf:params:xml:ns:netconf:base:1.0">
   <establish-subscription
         xmlns="urn:ietf:params:xml:ns:yang:ietf-subscribed-notifications">
       <stream>bios-log-trust-evidence</stream>
       <stream-subtree-filter>
           <xxx-vendor-device</pre>
                xmlns="urn:xxx:params:xml:ns:yang:xxx-vendor-device ">

    Selection Filters

               <device-id>xxxxxxxxxx</device-id>
           </xxx-vendor-device>
       </stream-subtree-filter>
           <tpm-name>tpm1</tpm-name>
       </tpms>
       <last-entry-value>0xa34568baac79</last-entry-value>
       <log-type>bios</log-type>
       <pcr-list>
           <pcr>>
               <pcr-indices>2</pcr-indices>
                                                                                 Subscription Parameters
               <pcr-indices>4</pcr-indices>
               <pcr-indices>8</pcr-indices>
               <hash-algo>
                  <tcg-hash-algo-id>TPM ALG SHA256</tcg-hash-algo-id>
               </hash-algo>
           </pcr>
       </pcr-list>
       <yp:periodic>
           <yp:period>500
                                                                                 Period Time
       </yp:periodic>
   </establish-subscription>
</rpc>
```

Next Steps

 Get feedback from the group: are you interested? any comments?

 Keep on update: how to customize YANG pub sub & push mechanisms for the remote attestation process with its full potential?

Thank you!
