Concise Binary Object Representation (CBOR) Tags for Date
draft-ietf-cbor-date-tag-05

Abstract

The Concise Binary Object Representation (CBOR, RFC 7049) is a data format whose design goals include the possibility of extremely small code size, fairly small message size, and extensibility without the need for version negotiation.

In CBOR, one point of extensibility is the definition of CBOR tags. RFC 7049 defines two tags for time: CBOR tag 0 (RFC 3339 date/time string) and tag 1 (Posix "seconds since the epoch"). Since then, additional requirements have become known. This specification defines a CBOR tag for an RFC 3339 date text string, for applications needing a textual date representation within the Gregorian calendar without a time. It also defines a CBOR tag for days since the date 1970-01-01 in the Gregorian calendar for applications needing a numeric date representation without a time. This specification is intended as the reference document for IANA registration of the CBOR tags defined.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at https://datatracker.ietf.org/drafts/current/.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on January 17, 2021.

Table of Contents

1. Introduction

The Concise Binary Object Representation (CBOR) [RFC7049] provides for the interchange of structured data without a requirement for a pre-agreed schema. RFC 7049 defines a basic set of data types, as well as a tagging mechanism that enables extending the set of data types supported via an IANA registry.

This specification defines a CBOR tag for a text string representing a date without a time. The tagged text string is represented as specified by the RFC 3339 [RFC3339] "full-date" production. Per RFC 3339, this represents a date within the Gregorian calendar.

This specification also defines a CBOR tag for an integer representing a date without a time. The tagged integer is an

unsigned or negative value indicating the number of days since the Gregorian calendar date 1970-01-01. As an implementation note, this value has a constant offset from the Modified Julian Date value (which is defined by the Smithsonian Astrophysical Observatory as the number of days since November 17, 1858); this value is the Modified Julian Date minus 40587.

Note that since both tags are for dates without times, times of day, time zones, and leap seconds are not applicable to these values. These tags are both for representations of Gregorian calendar dates.

1.1. Calendar Dates

Calendar dates are used for numerous human use cases, such as marking the dates of significant events. For instance, John Lennon was born on October 9, 1940 and died on December 8, 1980. One such use case is driver's licenses, which typically include a date of birth. The dates used in this specification use the Gregorian calendar, as do those in RFC 3339 [RFC3339]. The time zones and actual times of these events are intentionally not represented in the calendar date.

The epoch chosen for the second tag, which represents days since the Gregorian calendar date 1970-01-01, is related to the IEEE Std 1003.1, 2013 Edition [POSIX.1] time epoch 1970-01-01T00:00:00Z UTC only insofar as both contain the date 1970-01-01. This should not be construed as indicating that dates using this tag represent either a specific time of day and/or time zone.

The day of the week (Sunday, Monday, Tuesday, etc.) is not explicitly represented in either of these date formats. However, deterministic algorithms that are beyond the scope of this specification can be used to derive the day of the week in the Gregorian calendar from dates represented in both of these formats.

1.1.1. Example Date Representations

This table contains example representations for dates using both tags.

Date	Tag 1004	Tag 100
October 9, 1940	"1940-10-09"	-10676
December 8, 1980	"1980-12-08"	3994

1.2. Comparing Dates

Comparison of dates in "full-date" format can be accomplished by normal string comparison, since by design, the digits representing the date are in fixed format and ordered from most significant to least significant. Comparison of numeric dates representing days since 1970-01-01 can be performed by normal integer comparison. Comparison of dates in other formats or using other calendars require conversions that are beyond the scope of this specification.

Note that different dates may correspond to the same moment in time, depending upon the time zone in which the date was determined. For instance, at many times of the day, a conference call occurring on a particular date in Japan will simultaneously occur on the previous date in Hawaii; at many times of the day, Japan's Friday corresponds with Hawaii's Thursday.

1.3. Comparing Dates and Date/Time Values

Comparing dates with date/time values, which represent a particular moment in time, is beyond the scope of this specification. That said, if a date is augmented with a time zone and time of day, a specific date/time value can be determined and comparing that date/time value to others becomes possible. For instance, if one were to augment John Lennon's birth date of October 9, 1940 with the time of day and time zone of his birth, then it would be possible to derive a date/time at which he was born that could be compared with other date/time values.

2. IANA Considerations

2.1. Concise Binary Object Representation (CBOR) Tags Registrations

This section registers the following values in the IANA "Concise Binary Object Representation (CBOR) Tags" registry [IANA.cbor-tags].

- Tag: 1004
- Data Item: UTF-8 text string
- Semantics: RFC 3339 full-date string
- Reference: [[this specification]]

- Tag: 100 (ASCII 'd')
- Data Item: Unsigned or negative integer
- Semantics: Number of days since the epoch date 1970-01-01
- Reference: [[this specification]]

3. Security Considerations

The security considerations of RFC 7049 apply; the tags introduced here are not expected to raise security considerations beyond those.

A date, of course, has significant security considerations. These include the exploitation of ambiguities where the date is security relevant or where the date is used in access control decisions.

When using a calendar date for decision making, for example access control, it needs to be noted that since calendar dates do not represent a specific point in time, the results of the evaluation can differ depending upon where the decision is made. For instance, a person may have reached their 21st birthday in Japan while simultaneously being a day short of their 21st birthday in Hawaii.

Acknowledgements

Thanks to Carsten Bormann for supporting creation of this specification. Parts of the explanatory text in this specification come from draft-bormann-cbor-time-tag-02.

Thanks to these people for reviews of the specification: Henk Birkholz, Carsten Bormann, Thiago Macieira, Francesca Palombini,

Michael Richardson, Jim Schaad, Juergen Schoenwaelder, and Dale Worley.

Document History

[[to be removed by the RFC Editor before publication as an RFC]]

-05

- Incorporated additional suggestions by Carsten Bormann and Juergen Schoenwaelder.

-04

- Addressed shepherd comments by Francesca Palombini.
- Addressed additional review comments by Jim Schaad and Michael Richardson.

-03

- Added statement that these tags are both for representations of calendar dates.
- Described consequences of using calendar dates in access control decisions.

-02

- Addressed working group last call comments, including stating that time zones are not applicable to these values.

-01

- Changed "positive or negative" to "unsigned or negative".
- Added an implementation note about the relationship to Modified Julian Dates.

-00

- Initial working group version based on draft-jones-cbor-date-tag-01 with no normative changes.
