Conveying a Certificate Signing Request (CSR) in a Secure Zero Touch
Provisioning (SZTP) Bootstrapping Request
draft-kwatsen-netconf-sztp-csr-01

Abstract

This draft extends the "get-bootstrapping-data" RPC defined in RFC 8572 to include an optional certificate signing request (CSR), enabling a bootstrapping device to additionally obtain an identity certificate (e.g., an LDevID, from IEEE 802.1AR) as part of the "onboarding information" response provided in the RPC-reply.

Editorial Note (To be removed by RFC Editor)

This draft contains many placeholder values that need to be replaced with finalized values at the time of publication. This note summarizes all of the substitutions that are needed. No other RFC Editor instructions are specified elsewhere in this document.

Artwork in this document contains shorthand references to drafts in progress. Please apply the following replacements:

- * "XXXX" --> the assigned numerical RFC value for this draft
- * "AAAA" --> the assigned RFC value for I-D.ietf-netconf-crypto-types

Artwork in this document contains a placeholder value for the publication date of this draft. Please apply the following replacement:

- * "2020-06-10" --> the publication date of this draft

This document contains references to other drafts in progress, both in the Normative References section, as well as in body text throughout. Please update the following references to reflect their final RFC assignments:

- * I-D.ietf-netconf-crypto-types

- * I-D.ietf-netconf-keystore
- * I-D.ietf-netconf-trust-anchors
- * I-D.ietf-netmod-factory-default

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 12 December 2020.

1. Introduction

1.1. Overview

This draft extends the "get-bootstrapping-data" RPC defined in [RFC8572] to include an optional certificate signing request (CSR) [RFC2986], enabling a bootstrapping device to additionally obtain an identity certificate (e.g., an LDevID [Std-802.1AR-2018]) as part of the "onboarding information" response provided in the RPC-reply.

1.2. Terminology

This document uses the following terms from [RFC8572]:

- * Bootstrap Server
- * Bootstrapping Data
- * Conveyed Information
- * Device
- * Manufacturer
- * Onboarding Information
- * Signed Data

This document defines the following new terms:

SZTP-client The term "SZTP-client" refers to a "device" that is using a "bootstrap server" as a source of "bootstrapping data".

SZTP-server The term "SZTP-server" is an alternative term for "bootstrap server" that is symmetric with the "SZTP-client" term.

1.3. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

2. The "ietf-sztp-csr" Module

This section defines a YANG 1.1 [RFC7950] module that augments the "ietf-sztp-bootstrap-server" module defined in [RFC8572] and defines a YANG "structure".

The augmentation adds two nodes ("csr-support" and "csr") to the "input" parameter of the "get-bootstrapping-data" RPC defined in [RFC8572].

The YANG structure, "request-info", defines data returned in the "error-info" node defined in Section 8 of [RFC8572].

2.1. Data Model Overview

The following tree diagram [RFC8340] illustrates the "ietf-sztp-csr" module. The diagram shows the definition of an augmentation adding descendent nodes "csr-support" and "csr" and the definition of a structure called "request-info".

In the order of their intended use:

- * The "csr-support" node is used by the SZTP-client to signal to the SZTP-server that it supports the ability the generate CSRs, per this specification. The "csr-support" parameter carries details regarding the SZTP-client's ability to generate CSRs.
- * The "request-info" structure is used by the SZTP-server to signal back to the SZTP-client its desire to sign a CSR. The "request-info" structure additionally communicates details about the CSR the SZTP-client is to generate.
- * The "csr" node is used by the SZTP-client to communicate its CSR to the SZTP-server. Not shown is how the SZTP-server communicates the signed certificate to the SZTP-client; how to do this is discussed later in this document.

===== NOTE: '\ ' line wrapping per BCP XXX (RFC XXXX) =====

module: ietf-sztp-csr

augment /ietf-sztp-bootstrap-server:get-bootstrapping-data/ietf-sz\tp-bootstrap-server:input:

```
+----- csr-support!
|   +----- key-generation!
|   |   +----- supported-algorithms
|   |   |   +----- algorithm-identifier*   binary

+--- csr-generation
|   +--- selected-format
|   |   +--- format-identifier   identityref
+--- cert-req-info?   binary
```

To further illustrate how the augmentation and structure defined by the "ietf-sztp-csr" module are used, below are two additional tree diagrams showing these nodes placed where they are used.

The following tree diagram [RFC8340] illustrates SZTP's "get-bootstrapping-data" RPC with the augmentation in place.

module: ietf-sztp-bootstrap-server

rpcs:

```

+---x get-bootstrapping-data

        +--ro csr-generation
          | +--ro selected-format
          | | +--ro format-identifier  identityref
        +--ro cert-req-info?  binary

```

2.2. Example Usage

| The examples below are encoded using JSON, but they could
 | equally well be encoded using XML, as is supported by SZTP.

An SZTP-client implementing this specification would signal to the bootstrap server its willingness to generate a CSR by including the "csr-support" node in its "get-bootstrapping-data" RPC, as illustrated below.

REQUEST

===== NOTE: '\ ' line wrapping per BCP XXX (RFC XXXX) =====

```
POST /restconf/operations/ietf-sztp-bootstrap-server:get-bootstrapping-data HTTP/1.1
HOST: example.com
Content-Type: application/yang.data+json
```

```
{
  "ietf-sztp-bootstrap-server:input" : {
    "hw-model": "model-x",
    "os-name": "vendor-os",
    "os-version": "17.3R2.1",
    "nonce": "extralongbase64encodedvalue=",
    "ietf-sztp-csr:csr-support": {
      "key-generation": {
        "supported-algorithms": {
          "algorithm-identifier": [
            "base64encodedvalue1=",
            "base64encodedvalue2=",
            "base64encodedvalue3="
          ]
        }
      },
      "csr-generation": {
        "supported-formats": {
          "format-identifier": [
            "ietf-sztp-csr:p10",
            "ietf-sztp-csr:cmc",
            "ietf-sztp-csr:cmp"
          ]
        }
      }
    }
  }
}
```

Assuming the SZTP-server wishes to prompt the SZTP-client to provide a CSR, then it would respond with an HTTP 400 (Bad Request) error code:

RESPONSE

HTTP/1.1 400 Bad Request
Date: Sat, 31 Oct 2015 17:02:40 GMT
Server: example-server
Content-Type: application/yang.data+json

```
{
  "ietf-restconf:errors" : {
    "error" : [
      {
        "error-type": "application",
        "error-tag": "missing-attribute",
        "error-message": "Missing input parameter",
        "error-info": {
          "ietf-sztp-csr:request-info": {
            "key-generation": {
              "selected-algortithm": {
                "algorithm-identifier": "base64EncodedValue=="
              }
            },
            "csr-generation": {
              "selected-format": {
                "format-identifier": "ietf-sztp-csr:cmc"
              }
            },
            "cert-req-info": "base64EncodedValue=="
          }
        }
      ]
    }
  }
}
```

Upon being prompted to provide a CSR, the SZTP-client would POST another "get-bootstrapping-data" request, but this time including the "csr" node to convey its CSR to the SZTP-server:

REQUEST

===== NOTE: '\ ' line wrapping per BCP XXX (RFC XXXX) =====

```
POST /restconf/operations/ietf-sztp-bootstrap-server:get-bootstrapi\
ng-data HTTP/1.1
HOST: example.com
Content-Type: application/yang.data+json
```

```
{
  "ietf-sztp-bootstrap-server:input" : {
    "hw-model": "model-x",
    "os-name": "vendor-os",
    "os-version": "17.3R2.1",
    "nonce": "extralongbase64encodedvalue=",
    "ietf-sztp-csr:csr": {
      "p10": "base64encodedvalue=="
    }
  }
}
```

The SZTP-server responds with "onboarding-information" (conveyed encoded inside the "conveyed-information" node) containing a signed identity certificate for the CSR provided by the SZTP-client:

RESPONSE

```
HTTP/1.1 200 OK
Date: Sat, 31 Oct 2015 17:02:40 GMT
Server: example-server
Content-Type: application/yang.data+json
```

```
{
  "ietf-sztp-bootstrap-server:output" : {
    "reporting-level": "verbose",
    "conveyed-information": "base64encodedvalue=="
  }
}
```

How the signed certificate is conveyed inside the onboarding information is outside the scope of this document. Some implementations may choose to convey it inside a script (e.g., SZTP's "pre-configuration-script"), while other implementations convey it inside the SZTP "configuration" node.

Following are two examples of conveying the signed certificate inside the "configuration" node. Both examples assume that the SZTP-client understands the "ietf-keystore" module defined in [I-D.ietf-netconf-keystore].

This first example illustrates the case where the signed certificate is for the same asymmetric key used by the SZTP-client's manufacturer-generated identity certificate (e.g., an IDevID). As such, the configuration needs to associate the newly signed certificate with the existing asymmetric key:

===== NOTE: '\ ' line wrapping per BCP XXX (RFC XXXX) =====

```
{
  "ietf-keystore:keystore": {
    "asymmetric-keys": {
      "asymmetric-key": [
        {
          "name": "Manufacturer-Generated Hidden Key",
          "public-key-format": "ietf-crypto-types:subject-public-key\
-info-format",
          "public-key": "base64encodedvalue==",
          "hidden-private-key": [null],
          "certificates": {
            "certificate": [
              {
                "name": "Manufacturer-Generated IDevID Cert",
                "cert": "base64encodedvalue=="
              },
              {
                "name": "Newly-Generated LDevID Cert",
                "cert": "base64encodedvalue=="
              }
            ]
          }
        }
      ]
    }
  }
}
```

This second example illustrates the case where the signed certificate is for a newly generated asymmetric key. As such, the configuration needs to associate the newly signed certificate with the newly generated asymmetric key:

===== NOTE: '\ ' line wrapping per BCP XXX (RFC XXXX) =====

```
{
  "ietf-keystore:keystore": {
    "asymmetric-keys": {
      "asymmetric-key": [
        {
          "name": "Manufacturer-Generated Hidden Key",
          "public-key-format": "ietf-crypto-types:subject-public-key\
-info-format",
          "public-key": "base64encodedvalue==",
          "hidden-private-key": [null],
          "certificates": {
            "certificate": [
              {
                "name": "Manufacturer-Generated IDevID Cert",
                "cert": "base64encodedvalue=="
              }
            ]
          }
        },
        {
          "name": "Newly-Generated Hidden Key",
          "public-key-format": "ietf-crypto-types:subject-public-key\
-info-format",
          "public-key": "base64encodedvalue==",
          "hidden-private-key": [null],
          "certificates": {
            "certificate": [
              {
                "name": "Newly-Generated LDevID Cert",
                "cert": "base64encodedvalue=="
              }
            ]
          }
        }
      ]
    }
  }
}
```

In addition to configuring the signed certificate, it is often necessary to also configure the Issuer's signing certificate so that the the device (i.e., STZP-client) can authenticate certificates presented by peer devices signed by the same issuer as its own. While outside the scope of this document, one way to do this would be to use the "ietf-truststore" module defined in [I-D.ietf-netconf-trust-anchors].

2.3. YANG Module

This module augments an RPC defined in [RFC8572], uses a data type defined in [I-D.ietf-netconf-crypto-types], has an normative references to [RFC2986] and [ITU.X690.2015], and an informative reference to [Std-802.1AR-2018].

```
<CODE BEGINS> file "ietf-sztp-csr@2020-06-10.yang"
```

```
module ietf-sztp-csr {
  yang-version 1.1;
  namespace "urn:ietf:params:xml:ns:yang:ietf-sztp-csr";
  prefix sztp-csr;

  import ietf-sztp-bootstrap-server {

3. Security Considerations

This document builds on top of the solution presented in [RFC8572] and therefore all the Security Considerations discussed in RFC 8572 apply here as well.

3.1. SZTP-Client Considerations

3.1.1. Ensuring the Integrity of Asymmetric Private Keys

The private key the SZTP-client uses for the dynamically-generated identity certificate **MUST** be protected from inadvertent disclosure in order to prevent identity fraud.

The security of this private key is essential in order to ensure the associated identity certificate can be used as a root of trust.

It is **RECOMMENDED** that devices are manufactured with an HSM (hardware security module), such as a TPM (trusted platform module), to generate and forever contain the private key within the security perimeter of the HSM. In such cases, the private key, and its associated certificates, **MAY** have long validity periods.

In cases where the device does not possess an HSM, or otherwise is unable to use an HSM for the private key, it is **RECOMMENDED** to regenerate the private key (and associated identity certificates) periodically. Details for how to generate a new private key and associate a new identity certificate are outside the scope of this document.

3.1.2. Reuse of a Manufacturer-generated Private Key

It is **RECOMMENDED** in [RFC8572] that devices are shipped from manufacturing with a secure device identity certificate (e.g., an IDDevID, from [Std-802.1AR-2018]). It is also **RECOMMENDED** that the private key for these necessarily long-lived certificates be stored in an HSM, such as a TPM. Lastly, per the previous consideration, when devices generate a new private key, it is also **RECOMMENDED** that the private key is protected by the HSM.

However, it is understood that space on an HSM chip may be limited, potentially to the point of not being able to store an additional private key for the CSR described in this document, and that it may not be possible to store hardware-protected keys outside the TPM (e.g., a TPM-encrypted key stored in non-volatile memory). In such cases, it is **RECOMMENDED** to reuse the existing hardware-protected private key rather than generate a second private key outside of protection afforded by the hardware.

3.1.3. Replay Attack Protection

This RFC enables an SZTP-client to announce an ability to generate new key to use for its CSR.

When the SZTP-server responds with a request for the device to generate a new key, it is essential that the device actually generates a new key.

Generating a new key each time enables the random bytes used to create the key to serve the dual-purpose of also acting like a "nonce" used in other mechanisms to detect replay attacks.

When a fresh public/private key pair is generated for the request, confirmation to the SZTP-client that the response has not been replayed is enabled by the SZTP-client's fresh public key appearing in the signed certificate provided by the SZTP-server.

When a public/private key pair associated with the IDevID used for the request, there may not be confirmation to the SZTP-client that the response has not been replayed; however, the worst case result is a lost certificate that is associated to the private key known only to the SZTP-client.

3.1.4. Connecting to an Untrusted Bootstrap Server

[RFC8572] allows SZTP-clients to connect to untrusted SZTP-servers, by blindly authenticating the SZTP-server's TLS end-entity certificate.

As is discussed in Section 9.5 of [RFC8572], in such cases the SZTP-client MUST assert that the bootstrapping data returned is signed, if the SZTP-client is to trust it.

However, the HTTP error message used in this document cannot be signed data, as described in RFC 8572.

Therefore, the solution presented in this document cannot be used when the SZTP-client connects to an untrusted SZTP-server.

Consistent with the recommendation presented in Section 9.6 of [RFC8572], SZTP-clients SHOULD NOT pass the "csr-support" input parameter to an untrusted SZTP-server. SZTP-clients SHOULD pass instead the "signed-data-preferred" input parameter, as discussed in Appendix B of [RFC8572].

3.1.5. Selecting the Best Origin Authentication Mechanism

When generating a new key, it is important that the client be able to provide additional proof to the CA that it was the entity that generated the key.

All of the certificate request formats defined in this document (e.g., CMS, CMP, etc.), not including a raw PKCS#10, support origin authentication.

These formats support origin authentication using both PKI and shared secret.

Typically only one possible origin authentication mechanism can possibly be used but, in the case that the SZTP-client authenticates itself using both TLS-level (e.g., IDevID) and HTTP-level credentials (e.g., Basic), as is allowed by Section 5.3 of [RFC8572], then the SZTP-client may need to choose between the two options.

In the case the SZTP-client must choose between the asymmetric key option versus a shared secret for origin authentication, it is RECOMMENDED that the SZTP-client choose using the asymmetric key option.

3.1.6. Clearing the Private Key and Associated Certificate

Unlike a manufacturer-generated identity certificate (e.g., IDevID), the deployment-generated identity certificate (e.g., LDevID) and the associated private key (assuming a new private key was generated for the purpose), are considered user data and SHOULD be cleared whenever the device is reset to its factory default state, such as by the "factory-reset" RPC defined in [I-D.ietf-netmod-factory-default].

3.2. SZTP-Server Considerations

3.2.1. Conveying Proof of Possession to a CA

3.2.2. Supporting SZTP-Clients that don't trust the SZTP-Server

[RFC8572] allows SZTP-clients to connect to untrusted SZTP-servers, by blindly authenticating the SZTP-server's TLS end-entity certificate.

As is recommended in Section 3.1.4 in this document, in such cases, SZTP-clients SHOULD pass the "signed-data-preferred" input parameter.

The reciprocal of this statement is that SZTP-servers, wanting to support SZTP-clients that don't trust them, SHOULD support the "signed-data-preferred" input parameter, as discussed in Appendix B of [RFC8572].

3.2.3. YANG Module Considerations

The recommended format for documenting the Security Considerations for YANG modules is described in Section 3.7 of [RFC8407]. However, the module defined in this document only augments two input parameters into the "get-bootstrapping-data" RPC in [RFC8572], and therefore only needs to point to the relevant Security Considerations sections in that RFC.

- * Security considerations for the "get-bootstrapping-data" RPC are described in Section 9.16 of [RFC8572].
- * Security considerations for the "input" parameters passed inside the "get-bootstrapping-data" RPC are described in Section 9.6 of [RFC8572].

4. IANA Considerations

4.1. The IETF XML Registry

This document registers one URI in the "ns" subregistry of the IETF XML Registry [RFC3688] maintained at <https://www.iana.org/assignments/xml-registry/xml-registry.xhtml#ns>. Following the format in [RFC3688], the following registration is requested:

URI: urn:ietf:params:xml:ns:yang:ietf-sztp-csr
Registrant Contact: The NETCONF WG of the IETF.
XML: N/A, the requested URI is an XML namespace.

4.2. The YANG Module Names Registry

This document registers one YANG module in the YANG Module Names registry [RFC6020] maintained at <https://www.iana.org/assignments/yang-parameters/yang-parameters.xhtml>. Following the format defined in [RFC6020], the below registration is requested:

name: ietf-sztp-csr
namespace: urn:ietf:params:xml:ns:yang:ietf-sztp-csr
prefix: sztp-csr
reference: RFC XXXX
