RFC 8109

- March 2017
- Explained how to prime
- After it was published (*insert sound of a loud sigh here*), some questions were asked:
  - What is its relationship to RFC 8806 (was 7706)
  - Why do some priming lists have domain names in them?
  - What about the TC bit?
  - What about private networks

This draft

- Small updates to answer those questions

- Use clearer terminology from RSSAC about root servers
  - The domain names used to identify a root server is now a "root server identifier" instead of "root name server name"

Next steps

- If the WG adopts, this work can be done relatively quickly
