

# Deanonymizing Internet Traffic with Website Fingerprinting

**Nate Mathews**

*nate.mathews@mail.rit.edu*

**Advisor:** Dr. Matthew Wright

*matthew.wright@rit.edu*

**Rochester Institute of Technology**  
Global Cybersecurity Institute

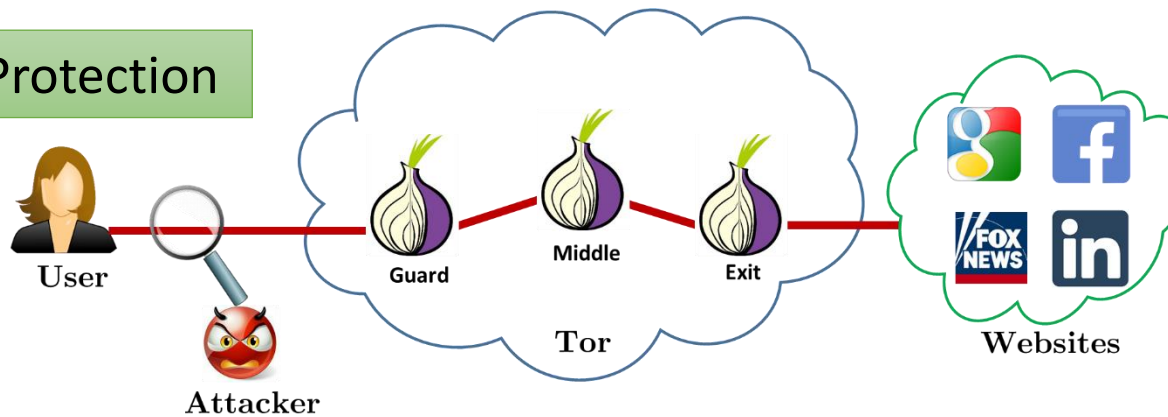

# Internet Anonymity

## No Protection

## Tor Protection

## Tor Anonymity System

- Incrementally creating a circuit
- Sophisticated encryptions
- **No individual node has the complete path information**

**The attacker fails to link user to the actual website she is visiting**

# Internet Anonymity

- **Website Fingerprinting (WF)**

- Try to link **the client** to **the website**

**Information Leak**  
- Number of Packets Statistic  
- Burst of packets  
  
\* **Unique for each website**

Network Traffic

**Concealed by Tor**

# Website Fingerprinting

- **Experimental design**

- Closed-world

- Benchmark

- Open-world

- Comparable to real-world

Unmonitored (open-world)

# Website Fingerprinting

- **WF attacks using hand-crafted features** *[Panchenko et. al, Hayes et. al]*
  - Designed features
  - Machine learning classifiers
    - SVM, Random Forest, k-NN

- Panchenko et al. *Website fingerprinting at internet scale*, NDSS 2016

- Hayes and Danezis. *k-Fingerprinting: A robust scalable website fingerprinting technique*, USENIX 2016.

# Website Fingerprinting

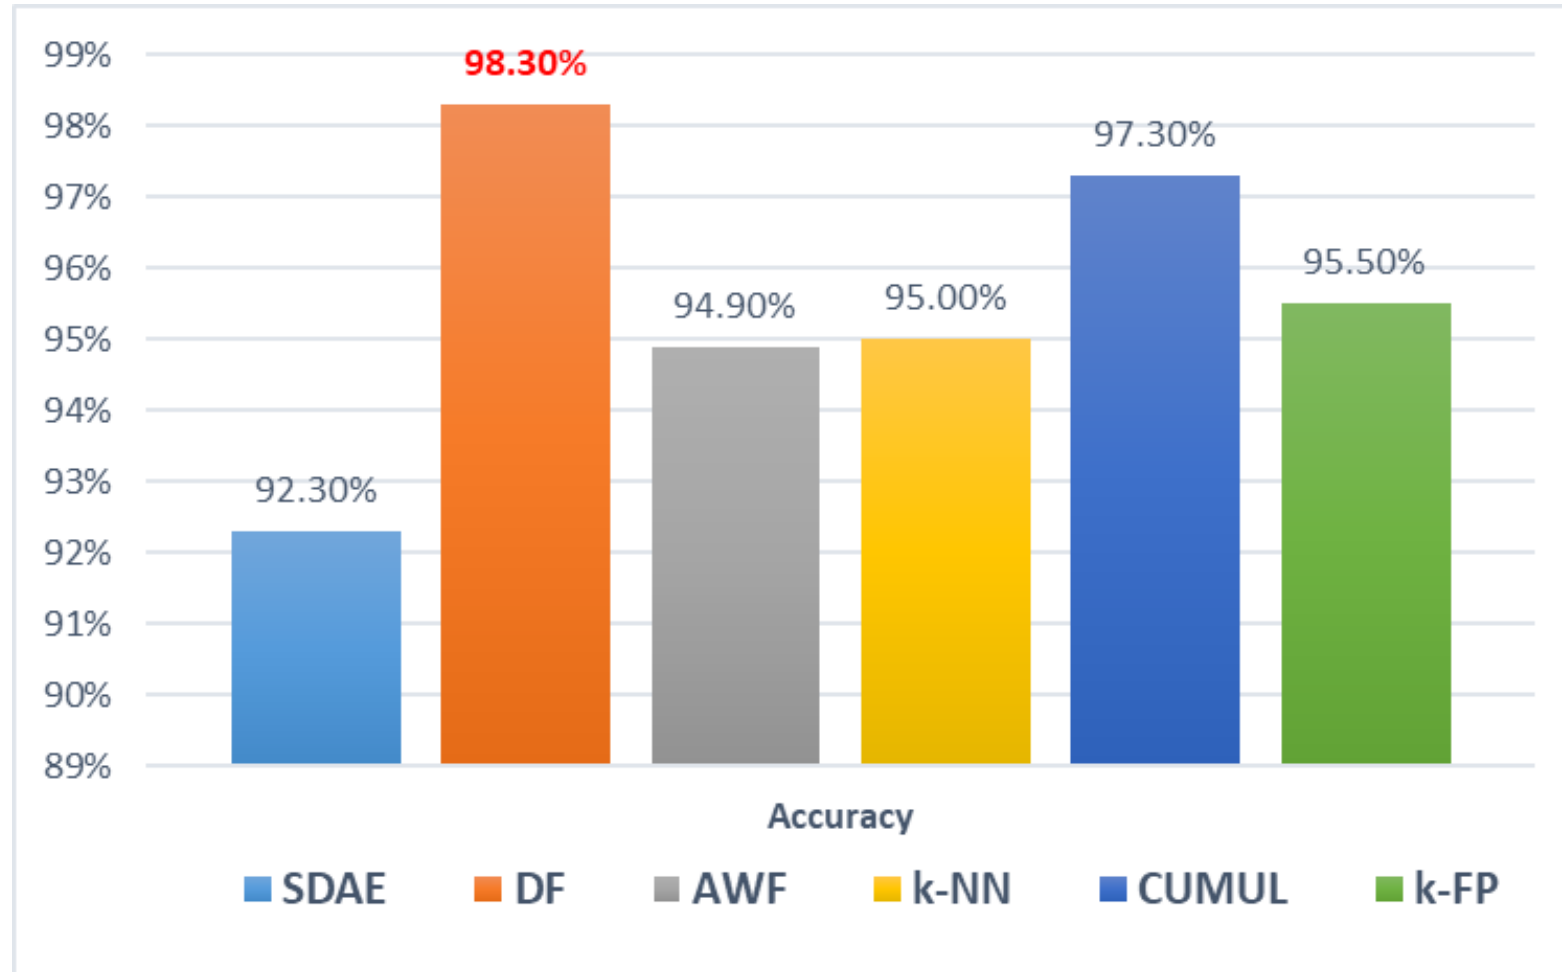

- **WF attacks using deep learning** *[Sirinam et. al, Bhat et al.]*
  - Automated feature learning
  - Higher performance
    - Larger data requirements

- Sirinam et al. *Deep Fingerprinting: Undermining Website Fingerprinting Defenses with Deep Learning*, CCS 2018
- Bhat et al. *Var-CNN: A Data-Efficient Website Fingerprinting Attack Based on Deep Learning*, PoPETS 2019

# Website Fingerprinting

- Closed-world performance

# Website Fingerprinting

- **New directions in WF attacks**
  - Improve performance in open-world
  - Improve attacker assumptions
    - *Lower data requirements*
    - *Webpage vs. Website fingerprinting*

# Recent-work: Triplet Fingerprinting

## 1. **Pre-training** step

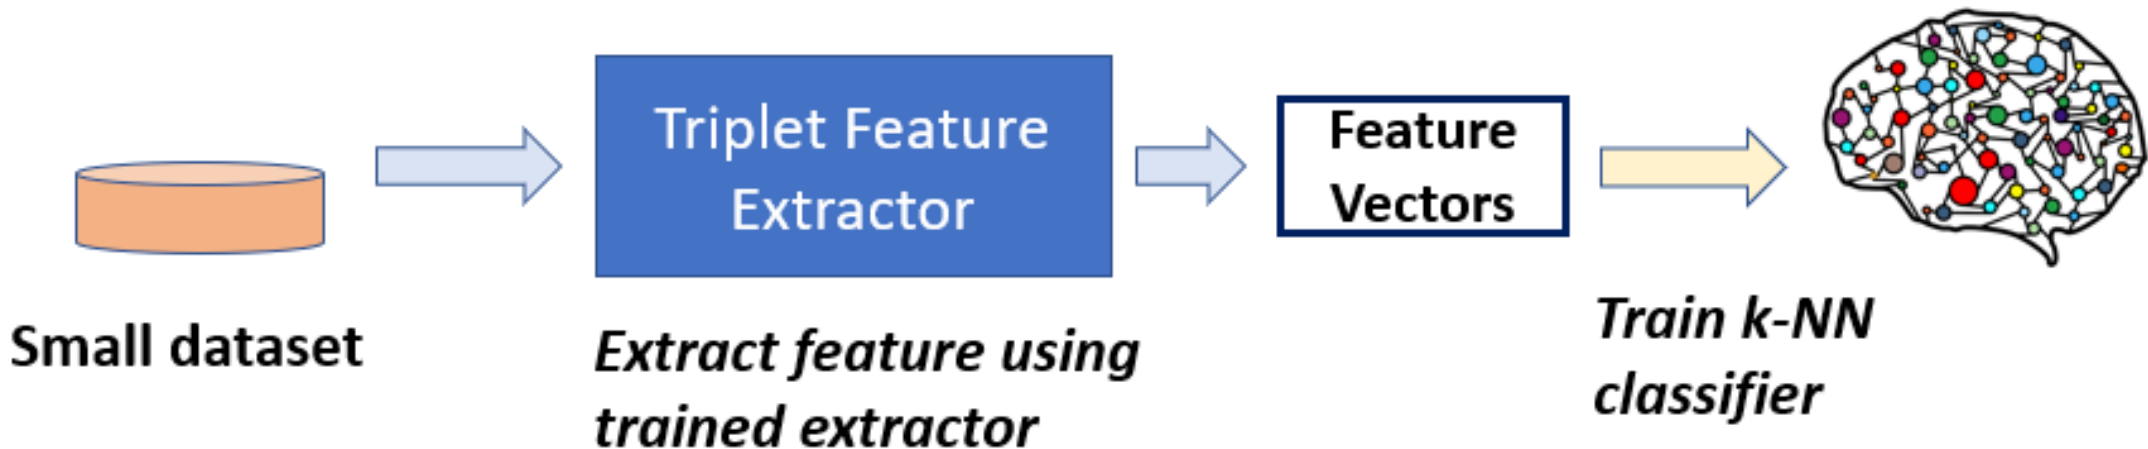

- Train triplet network as feature extractor
- Large, preexisting dataset
- Nontargeted

# Recent-work: Triplet Fingerprinting

## 2. **Training** step

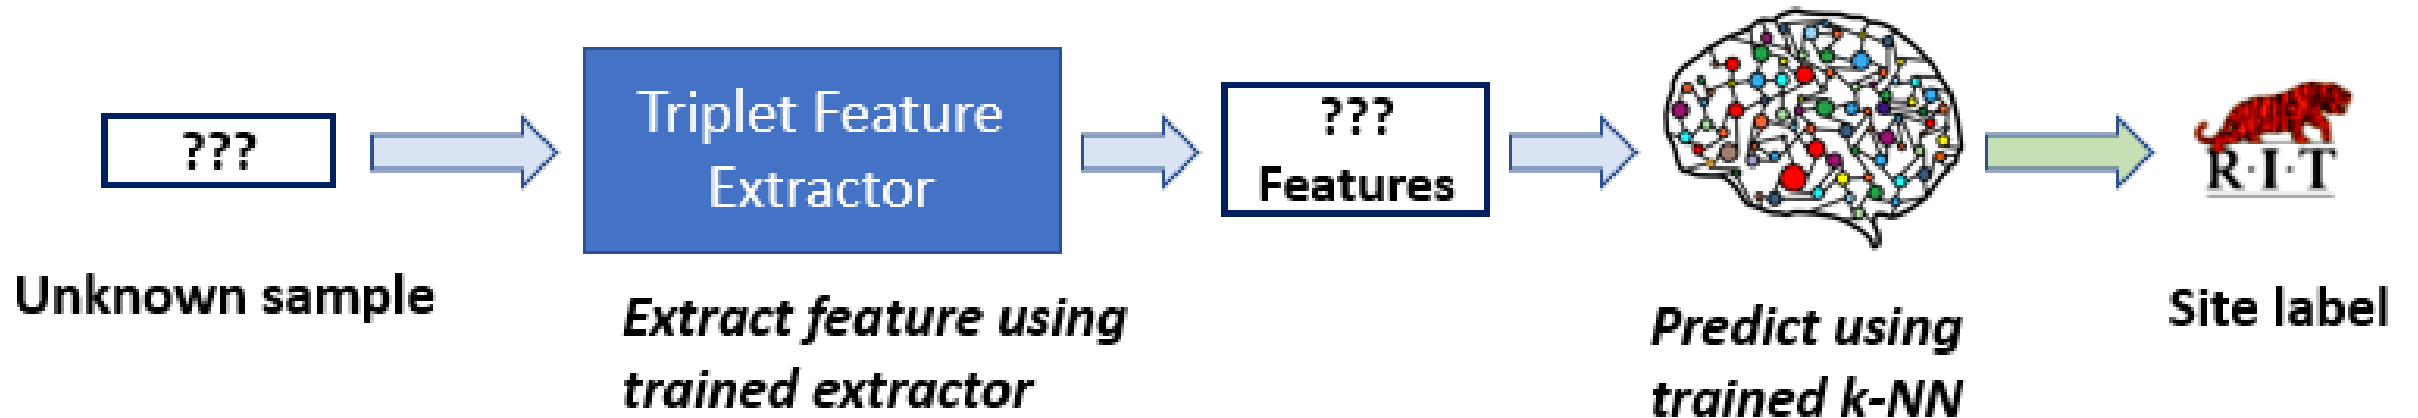

- Collected targeted data.
- Process into features and train classifier

# Recent-work: Triplet Fingerprinting

## 3. **Attack** step

- Capture unknown sample.
- Predict with trained classifier.

# Working Towards a Defense

*Why?*

# WF Defenses

- Hide patterns to confuse classifier

■ Outgoing packet  
■ Incoming packet

*Traffic Sample*

Add fake packets

Add delays

# WF Defenses

## – Popular strategies

- Stuff trace with fake traffic
  - High overheads harm network performance
- Create traffic pattern “collisions”
  - Lower overheads
  - Mathematical guarantees
  - Cumbersome to implement

# Ongoing-work: Adversarial Patches

**African-Elephant**  
(92% prediction)

+

=

**Baseball**  
(90% prediction)

**Adversarial Patch**

# Ongoing-work: Adversarial Patches

*Burst-based representation*

+2, -1, 0, -1, +1, -1, +1, -3, +5, -1, +4, -4, +9, -3, +1, -8, +2, -5, +1, -5, +6

*Dataset*

*Patching training*

**Adv. Traffic Patch**

+2, -1, 0, -1, +1, -1, +1, -3, +5, -1, +4, -4, +5, -9, +8, +9, -5, +1, -5, +6

# WF Defense: Open Questions

- **How much defense is enough?**
- **Defending against future, unknown attack types.**

*Thanks for listening!*

**Questions?**
