JMAP for Calendars

https://tools.ietf.org/html/draft-ietf-jmap-calendars-04

① Adding invitations

- You will normally not have permission to modify events you do not own.

- This is fine if the server handles adding/updating events you receive invites too. But should a client be able to do this?

- If so, how? This bypasses permission checks.

② Participant Identities

- As per last meeting, plan to move to one set of identities per account (rather than per calendar), as events allowed in multiple calendars within the account.

- Should this be a datatype, not just an account property?

- If so, should it be merged with mail Identity, or a different datatype?

- When comparing the identity URI to a participant URI, what case sensitivity should be used?
