draft-moran-suit-report

What did that manifest do?

- Could use error codes?
  - Often ambiguous, poorly defined
- If only we could have a backtrace…
  - If we already have a copy of the manifest, what's needed to reconstruct the backtrace?

What defines the execution path of the manifest?

- Flow Control Commands?
  - Not really…
- Conditions?
  - Only if they fail!

How to know exactly what a manifest processor did

- Digest of root manifest

- Canonical URI for root manifest

- For each condition failure:
    - Manifest identifier
    - Section identifier
    - Section offset
    - Current Manifest/Dependency
    - "Failure Reason"

Open issues

- Interop with strict-order = False
- Anti-replay mechanism
