Constrained Voucher

BRSKI uses EST, HTTP and TLS

This draft proposes

- constrained voucher additions to voucher and use of SIDs
 - Extends coap-est draft with BRSKI extensions to EST
 - CoAP, CBOR, CMS, and COSE
- to support voucher transport for constrained devices

EST: Enrollment over Secure Transport

BRSKI: Bootstrapping of Remote Secure Key Infrastructures

SID: YANG Schema Item iDentifier

COSE: CBOR Signing and Encryption (RFC 8152)

CMS: Cryptographic message Syntax (RFC 5652)

CBOR: Concise Binary Object Representation (RFC 7049)

Updates in -10

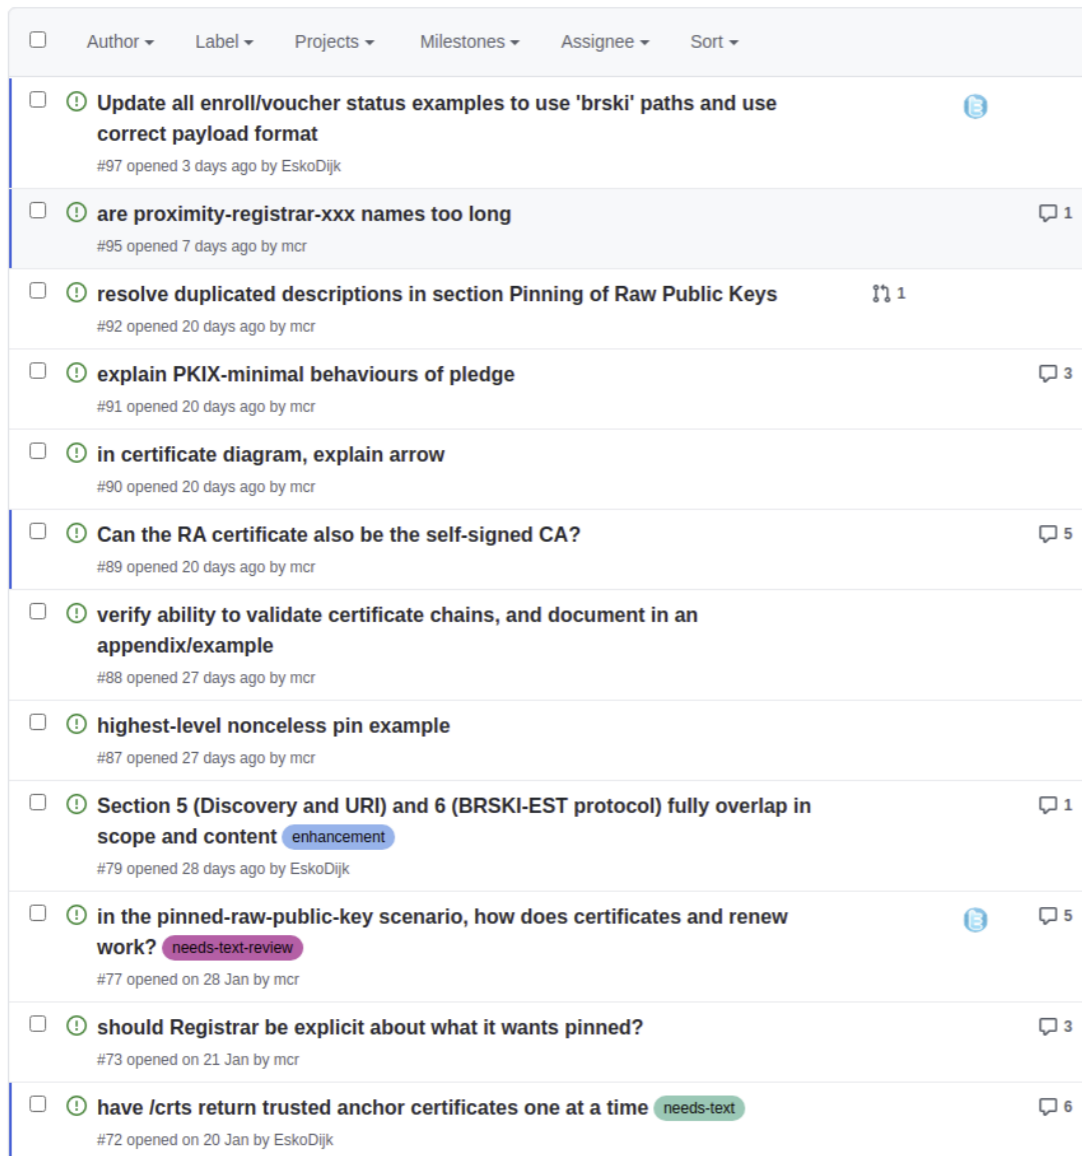

- excised remaining “CMS” bits, returned content-type OID
- requestauditlog removed, not part of BRSKI-EST
- rewrote almost every page
- made discovery optional for pledge, required for Registrar
- allow pledge to avoid trust anchor retrieval, if pinned key is CA key
- extensive clarification around which certificate is pinned
- clarified how Raw Public Key would work
- clarify that BRSKI-MASA protocol does not change

Issues for -11

- “proximity-registrar-subject-public-key-info” is awkwardly long. (But never sent over the wire)
- “proximity-registrar-sha256-of-subject-public-key-info” is annoying and does not fit into table.
 - please bikeshed better name!
- still have some IANA considerations to fix after est → brski change.
-

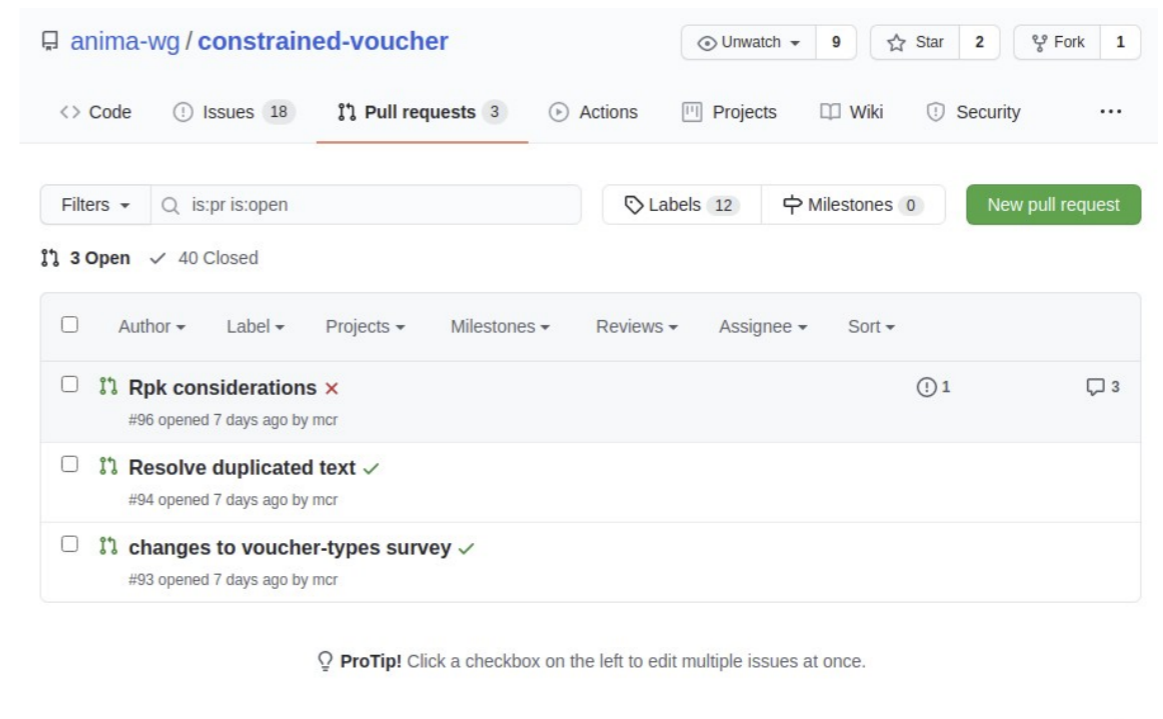

Thanks to weekly discussions in BRSKI design team on Thursday

Issues

A screenshot of a GitHub issues page for the repository anima-wg/constrained-voucher. The page shows a list of 12 issues, each with a title, a status icon (green circle with an exclamation mark), a comment count, and the author. The issues are:

- #97: Update all enroll/voucher status examples to use 'brski' paths and use correct payload format (opened 3 days ago by EskoDijk)
- #95: are proximity-registrar-xxx names too long (opened 7 days ago by mcr)
- #92: resolve duplicated descriptions in section Pinning of Raw Public Keys (opened 20 days ago by mcr)
- #91: explain PKIX-minimal behaviours of pledge (opened 20 days ago by mcr)
- #90: in certificate diagram, explain arrow (opened 20 days ago by mcr)
- #89: Can the RA certificate also be the self-signed CA? (opened 20 days ago by mcr)
- #88: verify ability to validate certificate chains, and document in an appendix/example (opened 27 days ago by mcr)
- #87: highest-level nonceless pin example (opened 27 days ago by mcr)
- #79: Section 5 (Discovery and URI) and 6 (BRSKI-EST protocol) fully overlap in scope and content (opened 28 days ago by EskoDijk)
- #77: in the pinned-raw-public-key scenario, how does certificates and renew work? (opened on 28 Jan by mcr)
- #73: should Registrar be explicit about what it wants pinned? (opened on 21 Jan by mcr)
- #72: have /crts return trusted anchor certificates one at a time (opened on 20 Jan by EskoDijk)

A screenshot of a GitHub pull requests page for the repository anima-wg/constrained-voucher. The page shows a list of 3 open pull requests, each with a title, a status icon (green circle with a checkmark), a comment count, and the author. The pull requests are:

- #96: Rpk considerations (opened 7 days ago by mcr)
- #94: Resolve duplicated text (opened 7 days ago by mcr)
- #93: changes to voucher-types survey (opened 7 days ago by mcr)

Below the list, there is a ProTip: Click a checkbox on the left to edit multiple issues at once.

Conclusion

- 1) depends upon draft-ietf-core-sid-15 and draft-ietf-core-yang-cbor-15, which are now in WGLC.
- 2) Currently 3 pull requests, 18 issues.
- 3) Expect to have DESIGN team meetings March 18, 25, April 1, 8, 15, 22. That's six meetings, expect to close all issues.
 - 1) **now** is time for cross-area review of documents.
 - 2) hoping to get same reviewers as for BRSKI

Constrained Join-proxy	ANIMA	CBOR multipart-ct draft	BRSKI with constrained join proxy and EST-coaps

Challenges with Asynchronous Registrar and pinning of public key

- In Asynchronous Registrar situation, the Southbound Pledge Interface has possibly many instances, each with its own certificate/public key.
- The pledge will pin the public key that it sees as the pinned-domain-subject-public-key-info. This is **just** the public key, and contains no certificate chain information.
- In simple/synchronous Registrar, the parboiled voucher-request would get signed by the same key pair as is pinned by the pledge. The MASA would therefore be able to see an entire certificate chain (from the x5u COSE pair, see draft-ietf-cose-x509-06 section 2), and would know who the registrar is.
 - (it would still put the required public key into the voucher)
- In the asynchronous registrar situation, then the relationship is not obvious, so the Registrar **MUST** include additional certificates leading to a common Root Certificate.
