PCEP Extension for Native IP Network

draft-ietf-pce-pcep-extension-native-ip

A. Wang (China Telecom) B. Khasanov (Yandex) Sheng Fang (Huawei Technologies) Ren Tan(Huawei Technologies) Chun Zhun(ZTE Corporation)

IETF-110, March 2021

Motivation

- <u>RFC8735</u> describes the scenarios and simulation results for TE in Native IP network
- <u>Draft-ietf-teas-pce-native-ip</u> describes an architecture for providing traffic engineering in a native IP network by using multiple BGP sessions and a PCE-based central control mechanism.
- This document describes the PCEP extensions and procedures to practically build such architecture.

Overview of the Solution

- Building Dual/Multi BGP sessions between edge routers upon request via PCEP
- Advertises different prefixes via different BGP sessions, w/PCEP-based setup
- Steer traffic towards particular routes via BGP next-hop w/PCEP-based setup 3

PCEP Extensions

From Section 4-10 of the document:

- Capability Advertisement
- Related PCEP messages
- New PCEP Objects
- New Error-Type and Error-Value
- CCDR Native IP Procedures
- Operations Consideration

PCEP Capability Advertisement

• <u>RFC8408</u> defines the Path Setup Type Capability TLV to indicate the path

- New PST (TBD) is defined for Native IP path
- <u>Draft-ietf-pce-pcep-extension-for-pce-controller</u> defines the PCECC capability sub-tlv to exchange information about the PCECC capability
 - N(NATIVE-IP-TE-CAPABILITY-1 bit=TBD) is defined for PCEP speaker

Figure 7: PCECC Capability sub-TLV

Updated PCEP Messages

<PCInitiate Message> ::= <Common Header> <PCE-initiated-lsp-list>

Where:

<Common Header> is defined in [RFC5440]

<PCE-initiated-lsp-list> ::= <PCE-initiated-lsp-request>
 [<PCE-initiated-lsp-list>]

```
<PCE-initiated-lsp-request> ::=
(<PCE-initiated-lsp-instantiation>|
<PCE-initiated-lsp-deletion>|
<PCE-initiated-lsp-central-control>)
```

```
<PCE-initiated-lsp-central-control> ::= <SRP>
(<LSP>
<cci-list>) |
(((BPI>|<EPR>)<PPA>)
<CCI>)
```

<cci-list> ::= <CCI>
[<cci-list>]

Where:

<cci-list> is as per [<u>I-D.ietf-pce-pcep-extension-for-pce-controller</u>]. <PCE-initiated-lsp-instantiation> and <PCE-initiated-lsp-deletion> are as per [RFC8281].

The LSP and SRP object is defined in [RFC8231].

When PCInitiate message is used create Native IP instructions, the SRP and CCI objects MUST be present. The error handling for missing SRP or CCI object is as per

[<u>I-D.ietf-pce-pcep-extension-for-pce-controller</u>]. Further either one of BPI, EPR, or PPA object MUST be present. If none of them are present, the receiving PCC MUST send a PCErr message with Errortype=6 (Mandatory Object missing) and Error-value=TBD (Native IP object missing).

To cleanup the SRP object must set the R (remove) bit.

<PCRpt Message> ::= <Common Header> <state-report-list>

Where:

<state-report-list> ::= <state-report>[<state-report-list>]

<lsp-state-report> ::= [<SRP>] <LSP> <path>

Where:

<path> is as per [<u>RFC8231</u>] and the LSP and SRP object are also defined in [<u>RFC8231</u>].

<CCI>)

((<BPI>|<EPR>|<PPA>)

The error handling for missing CCI object is as per [<u>I-D.ietf-pce-pcep-extension-for-pce-controller</u>]. Further either one of BPI, EPR, or PPA object MUST be present. If none of them are present, the receiving PCE MUST send a PCErr message with Errortype=6 (Mandatory Object missing) and Error-value=TBD (Native IP object missing).

New PCEP Objects(1/4)

CCI: Central Controller Instructions

<u>CC-ID</u> is described in draft-ietf-pce-pcep-extension-for-pce-controller

Flags is used to carry any additional information pertaining to the CCI. Currently no flag bits are defined.

Symbolic Path Name TLV(RFC 8231) MUST be included in the above CCI-Object

New PCEP Objects(2/4)

BPI (BGP Peer Info) Object-Class is TBD

BPI Object-Type is for IPv4 and 2 for IPv6

$\begin{smallmatrix} 0 & 1 & 2 & 3 \\ 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 0 & 1 \\ \end{smallmatrix}$	0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1

New PCEP Objects(4/4)

PPA (Peer Prefix Association) Object-Class is TBD

PPA Object-Type is 1 for IPv4 and 2 for IPv6

0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 Peer IPv4 Address IPv4 Prefix subobjects -+-+-+-+-+-+ -+-+-+-+-+-+-+-+-+-+ Additional TLVs Figure 10: Peer Prefix Association Object Body Format for IPv4 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 -+-+-+-+-+-+-+-+ Peer IPv6 Address IPv6 Prefix subobjects 11 +-+-+-+-+-+-+-+ Additional TLVs Figure 11: Peer Prefix Association Object Body Format for IPv6

IPv4 Prefix sub-object/IPv6 Prefix sub-object is defined in RFC3209

New Error-Type and Error-Values

+======================================	+===============	+========++
Error-Type	Meaning	Error-value
TBD6 	Native IP TE failure	
		0: Unassigned
		TBD7: Peer AS not match
		TBD8:Peer IP can't be reached
		TBD9:Local IP is in use
		TBD10:Remote IP is in use
		TBD11:Exist BGP session broken
		TBD12:Explicit Peer Route Error
		TBD17:EPR/BPI Peer Info mismatch
		TBD18:BPI/PPA Address Family mismatch
		TBD19:PPA/BPI Peer Info mismatch
+		
Figure 12	2: Newlv defined	Error-Type and Error-Value

CCDR Native IP Procedures(1/3)

- PCEP messages (PCInitiate/PCRpt) are sent to R1、R3(RR)、R7 respectively, to build/remove the BGP sessions between R1/R3(RR) and R3(RR)/R7
- BPI Object is included
- "CC-ID" is unique, but "Symbolic Path Name" is constant for the E2E path
- "Local/Peer IP address" and "Peer AS" number is assigned within the BPI Object

BGP Session Establishment Procedures

CCDR Native IP Procedures(2/3)

- PCEP messages (PCInitiate/PCRpt) are sent to on-path routers R1、R2、R4 respectively, to install/remove the explicit route to the BGP nexthop
- EPR Object is included
- "CC-ID" is unique, but "Symbolic Path Name" is constant for the E2E path
- "Peer Address" and "Next Hop" information is assigned within the BPI Object. The route priority etc. for such path could also be assigned
- Reverse Path is built similarly from R7/R4/R2

Explicit Route Establish Procedures (From R1 to R7))

Red Link represent congested path (IGP shortest path) Green Link represent idle path (explicit route from PCE)

CCDR Native IP Procedures(3/3)

- PCEP messages (PCInitiate/PCRpt) are sent only to edge routers R1 or R7, to advertise/revoke the prefixes that associated with different BGP sessions
- PPA Object is included
- "CC-ID" is unique, but "Symbolic Path Name" is constant for the E2E path
- "Peer Address" and "Advertised Prefixes" information is assigned within the PPA Object
- Same AF prefixes should be advertised via the same AF sessions

BGP Prefix Advertisement Procedures

Operations Consideration

- The information transferred in this draft is mainly used for the light weight BGP session setup, explicit route deployment and the prefix distribution
- The planning, allocation and distribution of the peer addresses within IGP domain should be done in advance
- The state synchronization between PCE and PCC should follow the procedure that described in RFC8232
- When PCE detects one or some of PCCs are out of control, it should recompute and redeploy a traffic engineering path for native IP on active PCCs
- When PCC detects that connection with a PCE is lost, it should stale the information that initiated by PCE. A PCE should assure the avoidance of possible transient loop in such node failure case when it deploys the explicit peer route on the PCCs.

Next Step

- 1. Comments/Q&A
- 2. WG Last Call?
