

Information Model

draft-ietf-suit-information-model-08

Feedback from IESG review (1/2)

- Reasoning for UUIDs: why constrain this?
 - Text is harder for constrained devices to match. UUIDs are always 16 bytes
 - The text section is for human readable things
 - The vendor/class ID are for testing applicability not asserting properties
- Delegation mechanism too vague.
 - Currently, this is detailed in the manifest document
 - Should we add more detail in the information model

Feedback from IESG review (2/2)

- Requirement on secure time?
 - Used for expiration of manifests (REQ.SEC.EXP)
 - Should we include a reference time source?
