Multipath TCP (MPTCP)

MPTCP is a *multipath* extension to TCP

- Allows *n-to-m* TCP connections between end-hosts
- Originally proposed in 2013 (RFC 6824) and standardized in March 2020 (RFC 8684)
- Benefits over TCP
 - Improve aggregated **throughput**
 - Improve **resilience** to losses
 - Provides **seamless** mobility

MPTCP in the Internet

Large organizations have been using MPTCP for several years

- Apple uses MPTCP in iOS, Siri, Music, WiFi-Assist...
- Korea Telecom uses MPTCP to achieve Gigabit speeds over LTE+WiFi
- MPTCPv1 is available (and enabled) in Linux kernel v5.6 or newer

Yet there is no recent Internet-wide study analyzing MPTCP adoption!

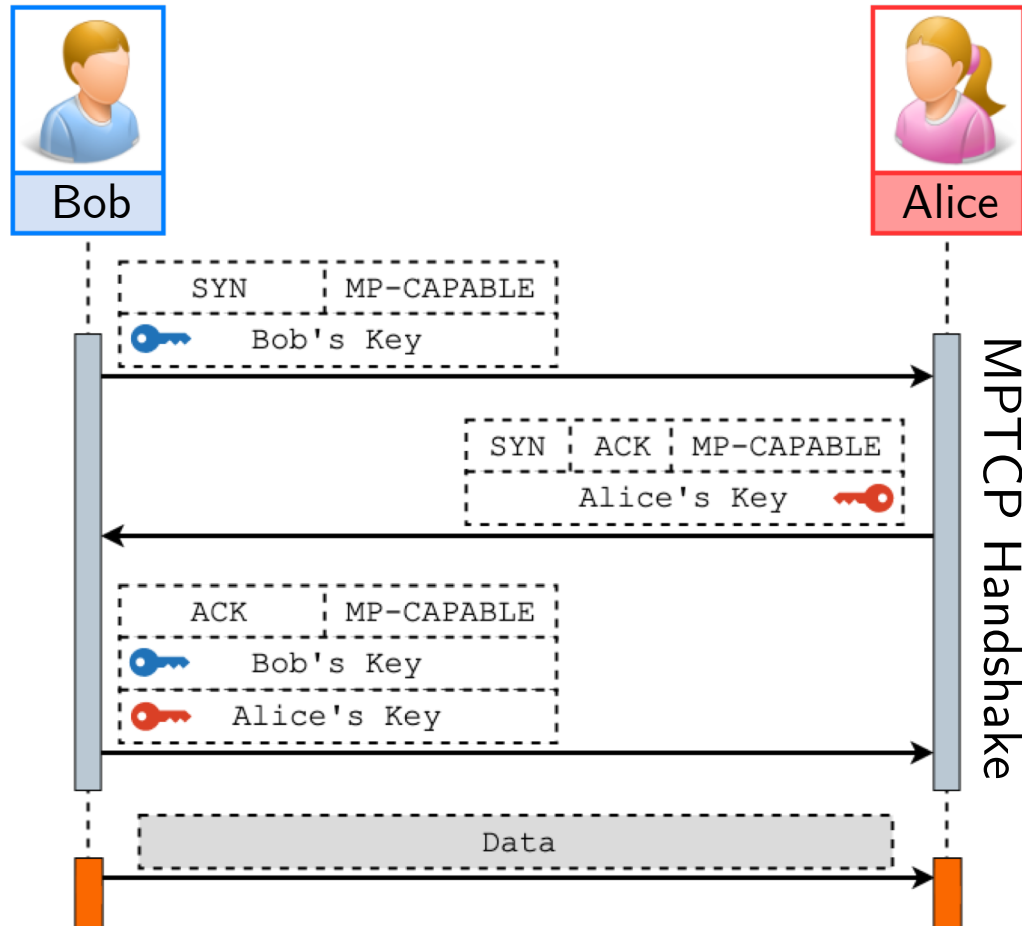

MPTCP in the Internet

Understanding MPTCP adoption is important:

1. Clients can only use MPTCP if **servers also** support it
2. MPTCP relies on TCP header extensions which are known to be blocked by middleboxes

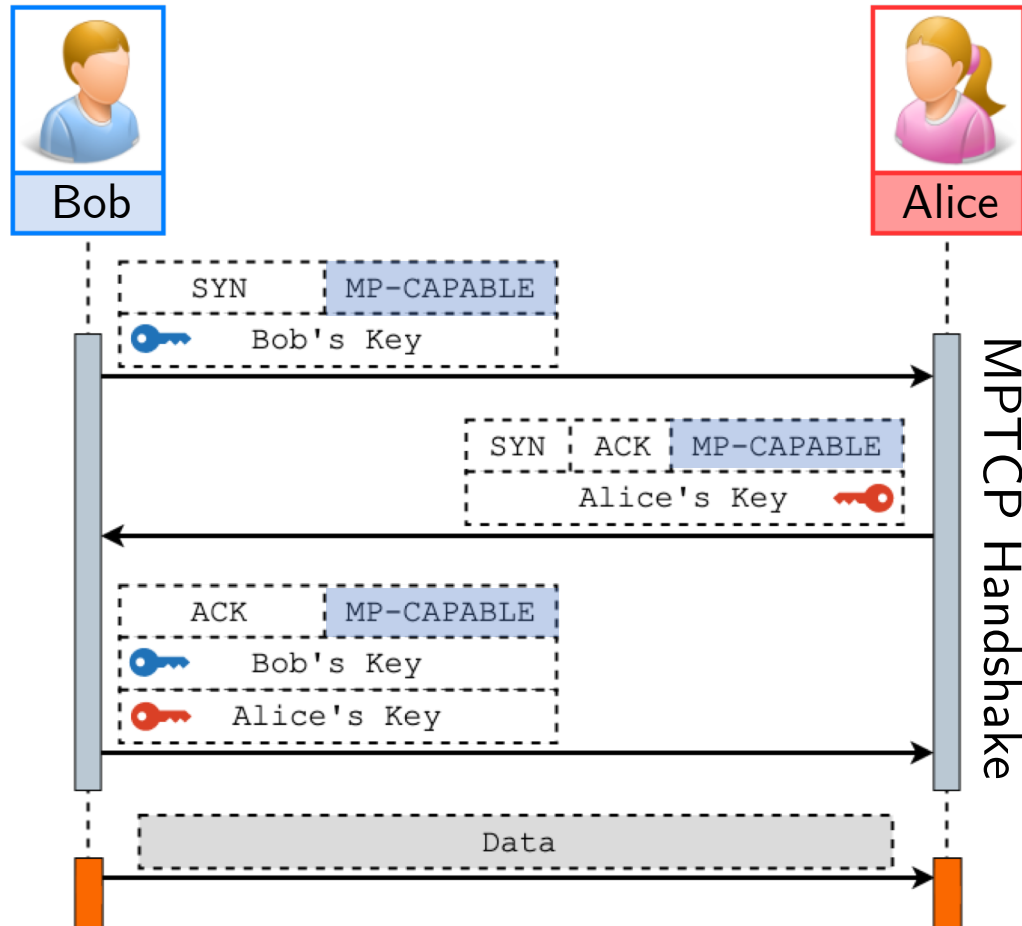

Scanning for MPTCPv0 Support

MPTCPv0 connection establishment leverages TCP's three-way handshake

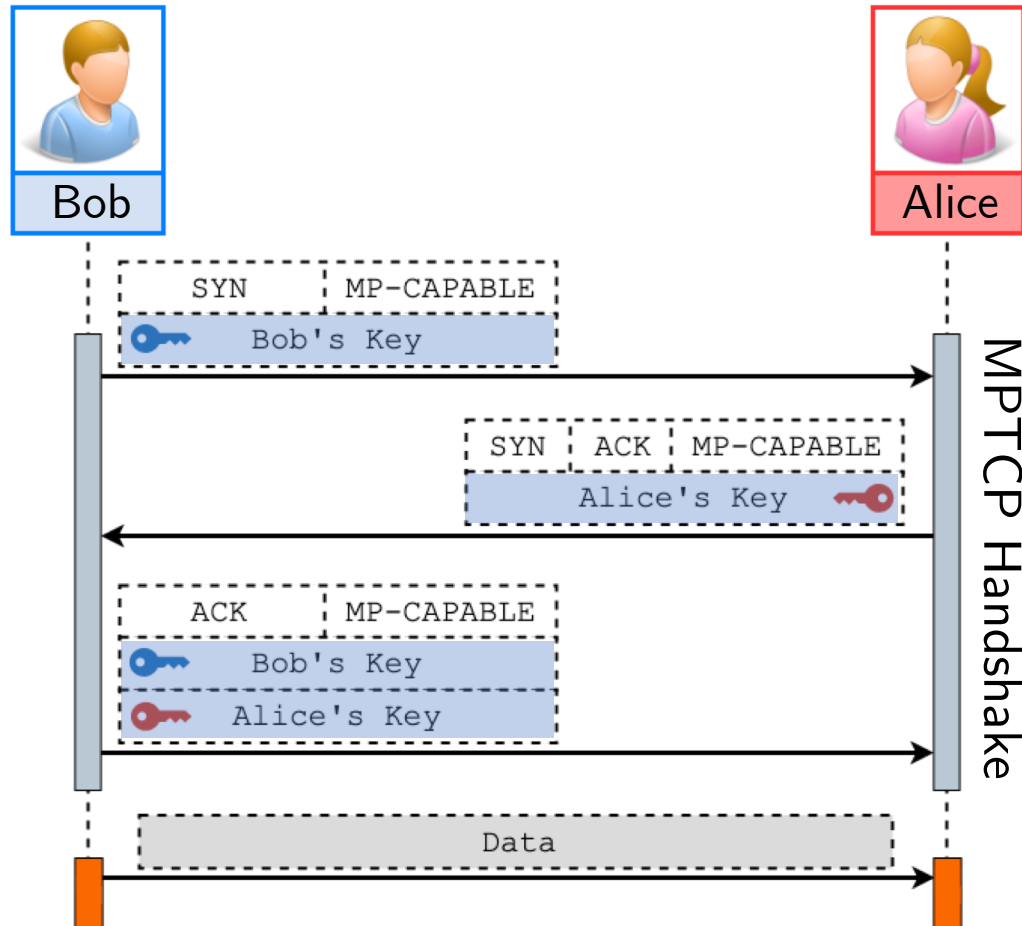

Scanning for MPTCP Support

MPTCPv0 connection establishment leverages TCP's three-way handshake

- Both hosts must send MP_CAPABLE flag to denote MPTCP capability

Scanning for MPTCP Support

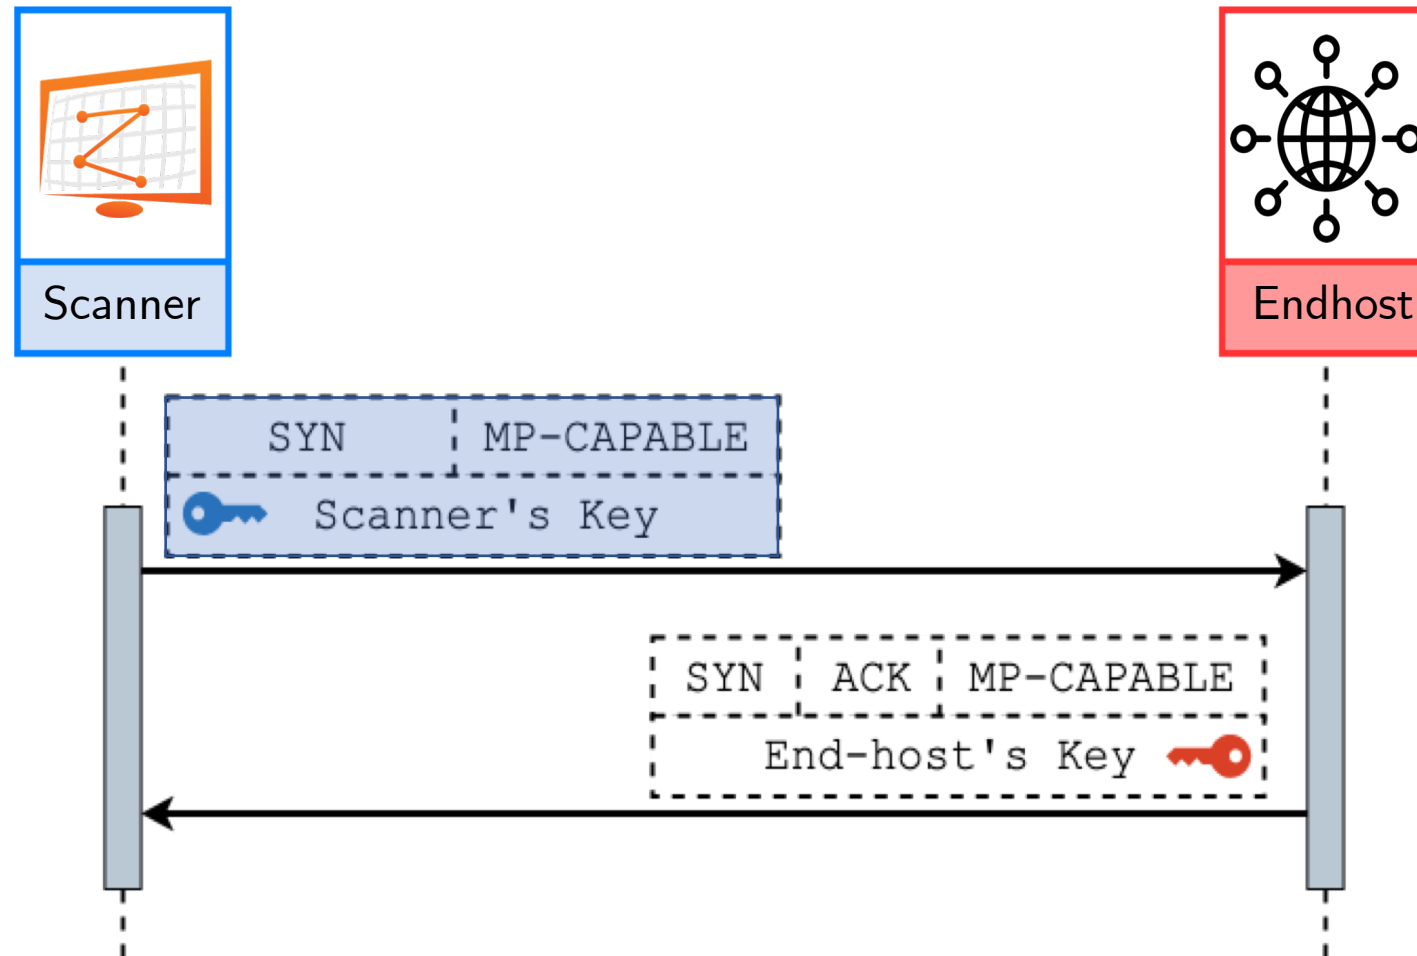

MPTCPv0 connection establishment leverages TCP's three-way handshake

- Both hosts must send MP_CAPABLE flag to denote MPTCP capability
- MPTCP Key is a random 64-bit sequence

ZMap Scanning Approach

MPTCPv0 Support in-the-wild

Over six months in 2020

IPv4 ZMap		July	August	September	October	November	December
Potential MPTCP	Port 80	179.5K	201.6K	197.1K	196.1K	205.4K	206.3K
	Port 443	211.1K	198.1K	-	232.7K	239.5K	233.8K

IPv6 ZMap		July	August	September	October	November	December
Potential MPTCP	Port 80	-	43	43	43	43	44
	Port 443	-	165	166	165	167	168

MPTCPv0 Support in-the-wild

Over six months in 2020

IPv4 ZMap		July	August	September	October	November	December
Potential MPTCP	Port 80	179.5K	201.6K	197.1K	196.1K	205.4K	206.3K
	Port 443	211.1K	198.1K	-	232.7K	239.5K	233.8K

But do all these hosts *truly* support MPTCP?

IPv6 ZMap		July	August	September	October	November	December
Potential MPTCP	Port 80	-	43	43	43	43	44
	Port 443	-	165	166	165	167	168

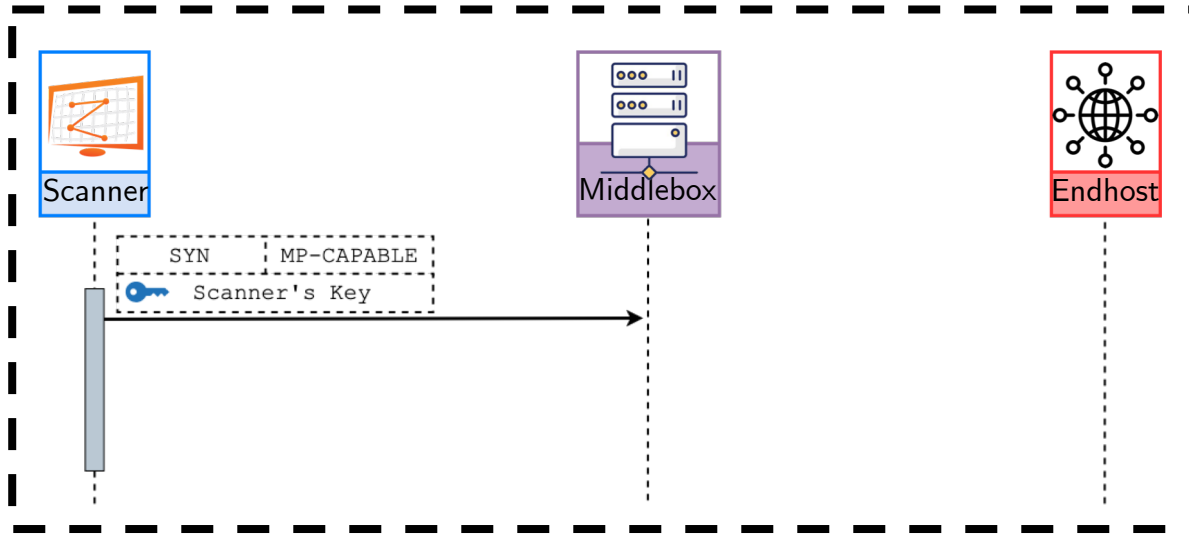

MPTCP over Middleboxes

Rule 3: Proxy

Analyzing True Support of MPTCP

Triggered Tracebox towards all potentially MPTCP hosts from ZMap

- Allows us to detect middleboxes that modified TCP options between end-hosts

Three broad categories:

1. Target host modified MPTCP options → True MPTCP
2. Intermediate hop modified MPTCP option → Middlebox-affected
3. Target did not respond → Unresponsive

True MPTCPv0 Support in the Internet

- Large number of MPTCP hosts in IPv4 are transient
- Only 6 middlebox-affected hosts in IPv4 *truly* support MPTCP
- MPTCP support is increasing in IPv4 but is almost constant in IPv6

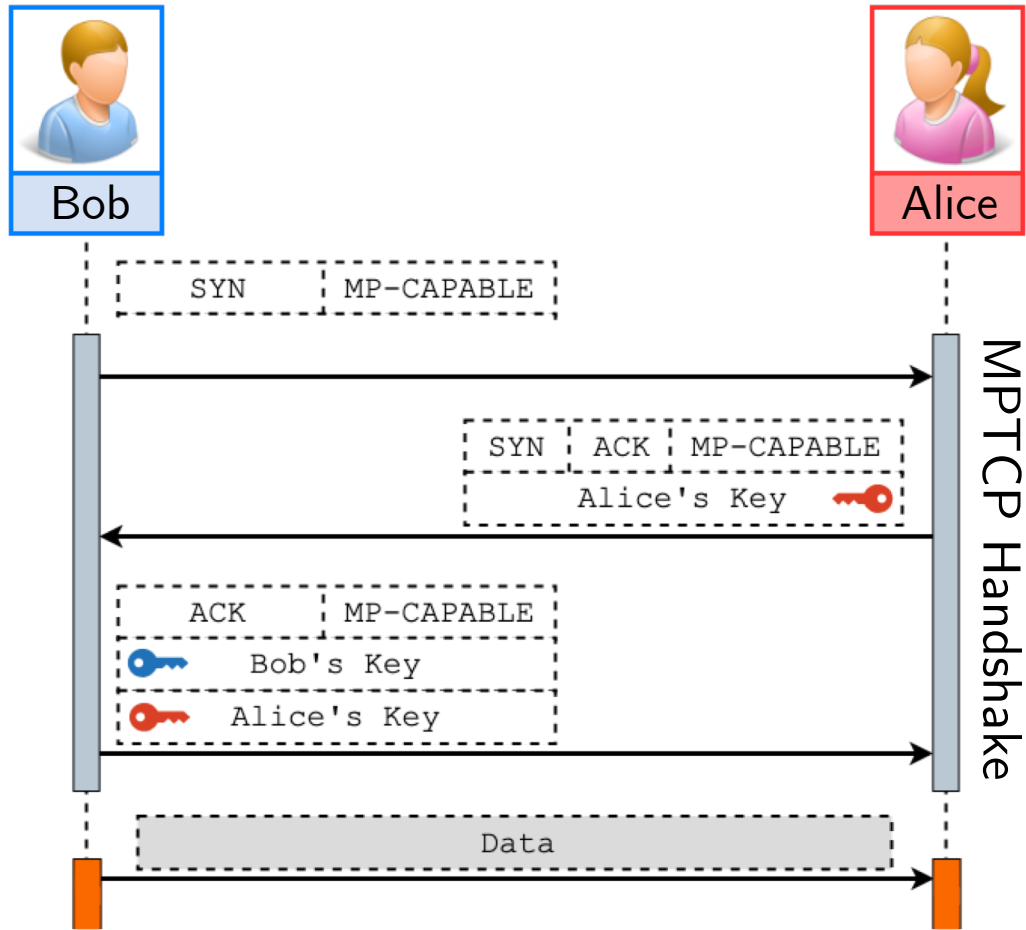

IPv4

Port 80: $\approx 5.5k$ Port 443: $\approx 4.5k$

IPv6

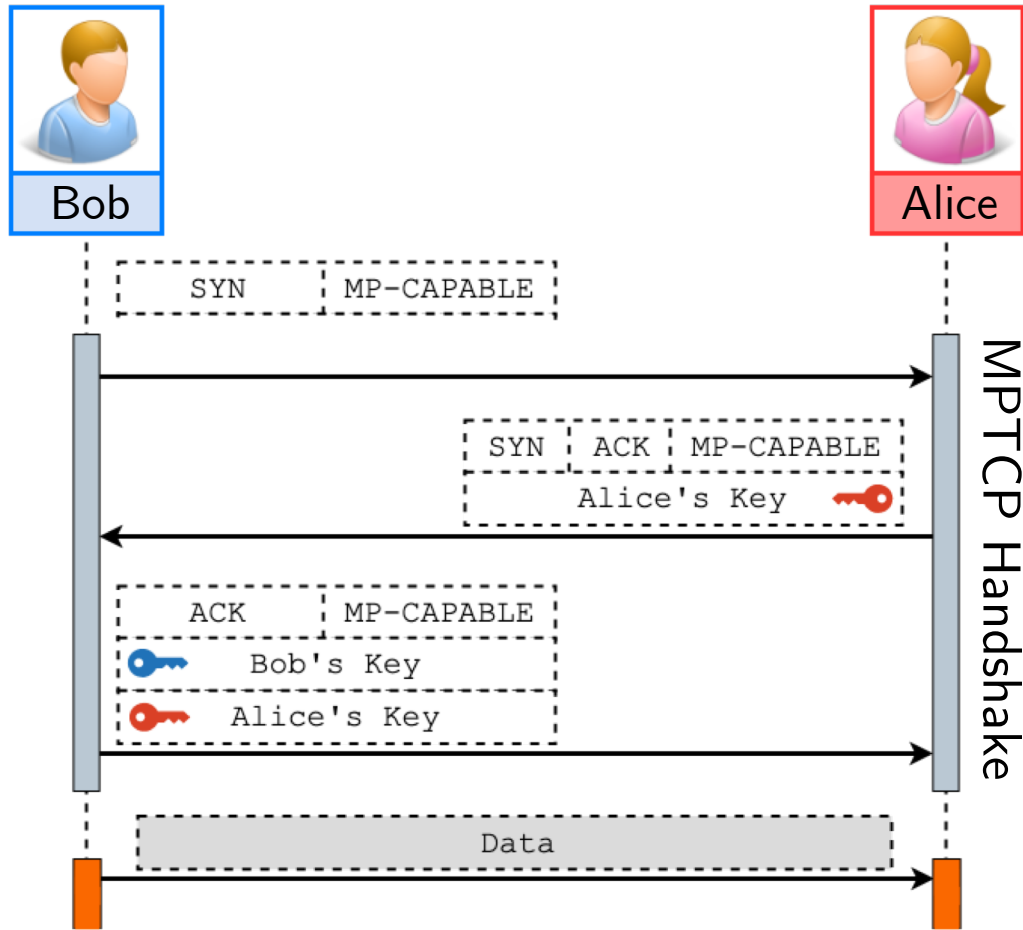

Port 80: 31 Port 443: 27

MPTCPv1 Support

MPTCPv1 removes sender's key in SYN

MPTCPv1 Support

MPTCPv1 removes sender's key in SYN

In May 2021

		MP_CAPABLE	MP_CAPABLE + Key
IPv4	Port 80	179194	184
	Port 443	170770	251
IPv6	Port 80	651	3
	Port 443	645	3

- Very high share of middlebox interference
- MPTCPv1 does not have a lot of activity compared to MPTCPv0
- MPTCPv1 while enabled by default, requires application to open MP_PROTO socket

MPTCP Adoption in a Nutshell
