

# iCalendar Relations

Mike Douglass November/2021

# XML REFERENCE

- Suggestion that text be added to security section warning of XML security issues
- Haven't located anything to copy or reference other than WebDAV warnings about XML entities.
- When the value is a REFERENCE type the targeted data is an XML document or portion thereof. Consumers need to be aware of the security issues related to XML processing - in particular those related to XML entities. See RFC4918 - Section 20.6

# LINK relations

- This spec is updating link relations - RFC 8288
- Mark Nottingham raised some issues
  - Should be serialization of RFC 8288
  - or - define own registry
- Already close to serialization
  - Use LABEL for title - title\* etc not needed?
- Prefer not to define own registry.
- Need to define context - the calendar entity.

# Useful LINK relations

- A number of existing relation types appear useful in calendar context - especially event publication.
  - author
  - copyright
  - payment
  - privacy-policy
  - terms-of-service
  - webmention
