# IETF 112 TEEP Hackathon

November 14, 2021  
Akira Tsukamoto (AIST)

# IETF 112 SUIT TEEP Hackathon

- Date November 2 Tuesday – November 5 Friday

Jointly with SUIT

- Participants:

Akira Tsukamoto, AIST

Brendan Moran, ARM

Kuniyasu Suzaki, TRASO/AIST

Hannes Tschofenig, ARM

Kohei Isobe, SECOM

Dave Thaler, Microsoft

Ken Takayama, SECOM

Masashi Kikuchi, TRASIO

Takahiko Nagata, TRASIO

# Background and objective

## Background

- TEEP requires SUIT, RATS and COSE
- Started implementing to support SUIT manifests in TEEP Update messages in TEEP protocol around IETF 111
- Would like to complete how to handle SUIT manifests on TEEP at IETF112
- After IETF112, start implement to support COSE and EAT in RATS on TEEP

## Objective

- Finalizing formats of SUIT manifests in the draft after trying the implementation
- Start looking in to COSE on TEEP messages, SUIT manifests already handling COSE, so use it as much as possible in the implementation

# What got done

## Implementations

- TAM: tamproto: Distribute the TC binary integrated in the SUIT manifest in TEEP Update
- libcsuit: Supporting three examples of suit manifests
- TEEP-device: Update TEEP message formats from draft-05 to 06
  - Adding handling COSE on SUIT manifests
  - Adding handling 'integrated-payload' (not complete)

## Feedback on drafts

- TEEP: When to include token or not in Update message
  - <https://github.com/ietf-teep/teep-protocol/issues/166>
- TEEP: Proposing cipher-suites to use cddl description in SUIT for TEEP
  - <https://github.com/ietf-teep/teep-protocol/issues/167>
- TEEP: Revising the suit manifest for deleting TC by using 'unlink'
  - <https://github.com/ietf-teep/teep-protocol/issues/168>
  - <https://github.com/ietf-teep/teep-protocol/pull/169>
- TEEP: Adding three examples of SUIT manifest formats <- description in following pages
  - <https://github.com/ietf-teep/teep-protocol/pull/161>
- SUIT: One line patch for defining ES256 used in SUIT examples
  - <https://github.com/suit-wg/manifest-spec/pull/50>

# Three SUIT manifest formats, Example 1 (1/2)

## Having one SUIT Manifest pointing to a URI of a Trusted Component Binary

- **Pros:**
  - The Trusted Component Developer can ensure that the intact Trusted Component Binary is downloaded by TEEP Devices
  - The TAM does not have to deliver Update message containing Trusted Component Binary which may have a large size
- **Cons:**
  - The Trusted Component Developer must host the Trusted Component Binary server
  - The TEEP Device must fetch the Trusted Component Binary in another connection after receiving an Update message

# Three SUIT manifest formats, Example 1 (2/2)

```
+-----+  
| TAM |  
+-----+
```

```
+-----+  
| TEEP Agent |  
+-----+
```

Update ---->↓

```
+===== teep-protocol (TAM) =====+  
TEEP_Message(  
  TEEP-TYPE=update,  
  options: {  
    manifest-list: [  
      += suit-manifest "tc-uuid.suit" (TC Developer) =+  
        SUIT_Envelope({  
          manifest: {  
            install: {  
              set-parameter: {  
                uri: "https://tc.org/tc-uuid.ta"  
              },  
              fetch  
            }  
          }  
        })  
      ]  
    }  
  })  
+=====+
```

and then, ↓

```
+-----+  
| TEEP Agent |  
+-----+
```

```
+-----+  
| TC Developer |  
+-----+
```

<----↓

fetch "<https://tc.org/tc-uuid.ta>"↓

```
+===== tc-uuid.ta =====+  
| 48 65 6C 6C 6F 2C 20 ... |  
+=====+
```

# Three SUIT manifest formats, Example 2 (1/2)

## Having a SUIT Manifest include the Trusted Component Binary

- **Pros:**

- The TEEP Device can obtain the Trusted Component Binary and its SUIT manifest together in one Update message
- The Trusted Component Developer does not have to host a server to deliver the Trusted Component Binary directly to TEEP Devices

- **Cons:**

- The TAM must host the Trusted Component Binary itself, rather than delegating such storage to the Trusted Component Developer
- The TAM must deliver Trusted Component Binaries with integrated SUIT manifest in Update messages, which may result increasing the Update message size

# Three SUIT manifest formats, Example 2 (2/2)

Update ---->↓

```
+===== teep-protocol(TAM) =====+
TEEP_Message([
  TEEP-TYPE-update,
  options: {
    manifest-list: [
      += suit-manifest(TC Developer) ==+
      SUIT_Envelope({
        "#tc": h' 48 65 6C 6C ...',
        manifest: {
          install: {
            set-parameter: {
              uri: "#tc"
            },
            fetch
          }
        }
      })
    ]
  }
])
```

# Format examples expanding in the draft

- Indispensable to keep compatibilities of implementation among different vendors
- Require breakdowns of binary representations when debugging between different TAM and TEEP devices
- It is good CBOR tutorial

# Summary

- Moving from purifying TEEP message itself, to defining and handling SUIT and COSE in TEEP message formats
- Implementation progressed for supporting SUIT manifests
- Draft updated related on SUIT and COSE from the hackathon
- Explaining three formats of SUIT manifests
- How do the examples looks of CBOR in TEEP
- After 112, many remaining on COSE and EAT on TEEP protocol

A part of this hackathon presentation is based on results obtained from a project, JPNP16007, commissioned by the New Energy and Industrial Technology Development Organization (NEDO).
