

Sustainability for Community Networks - Exploring Open-Source billing solutions

Presented by

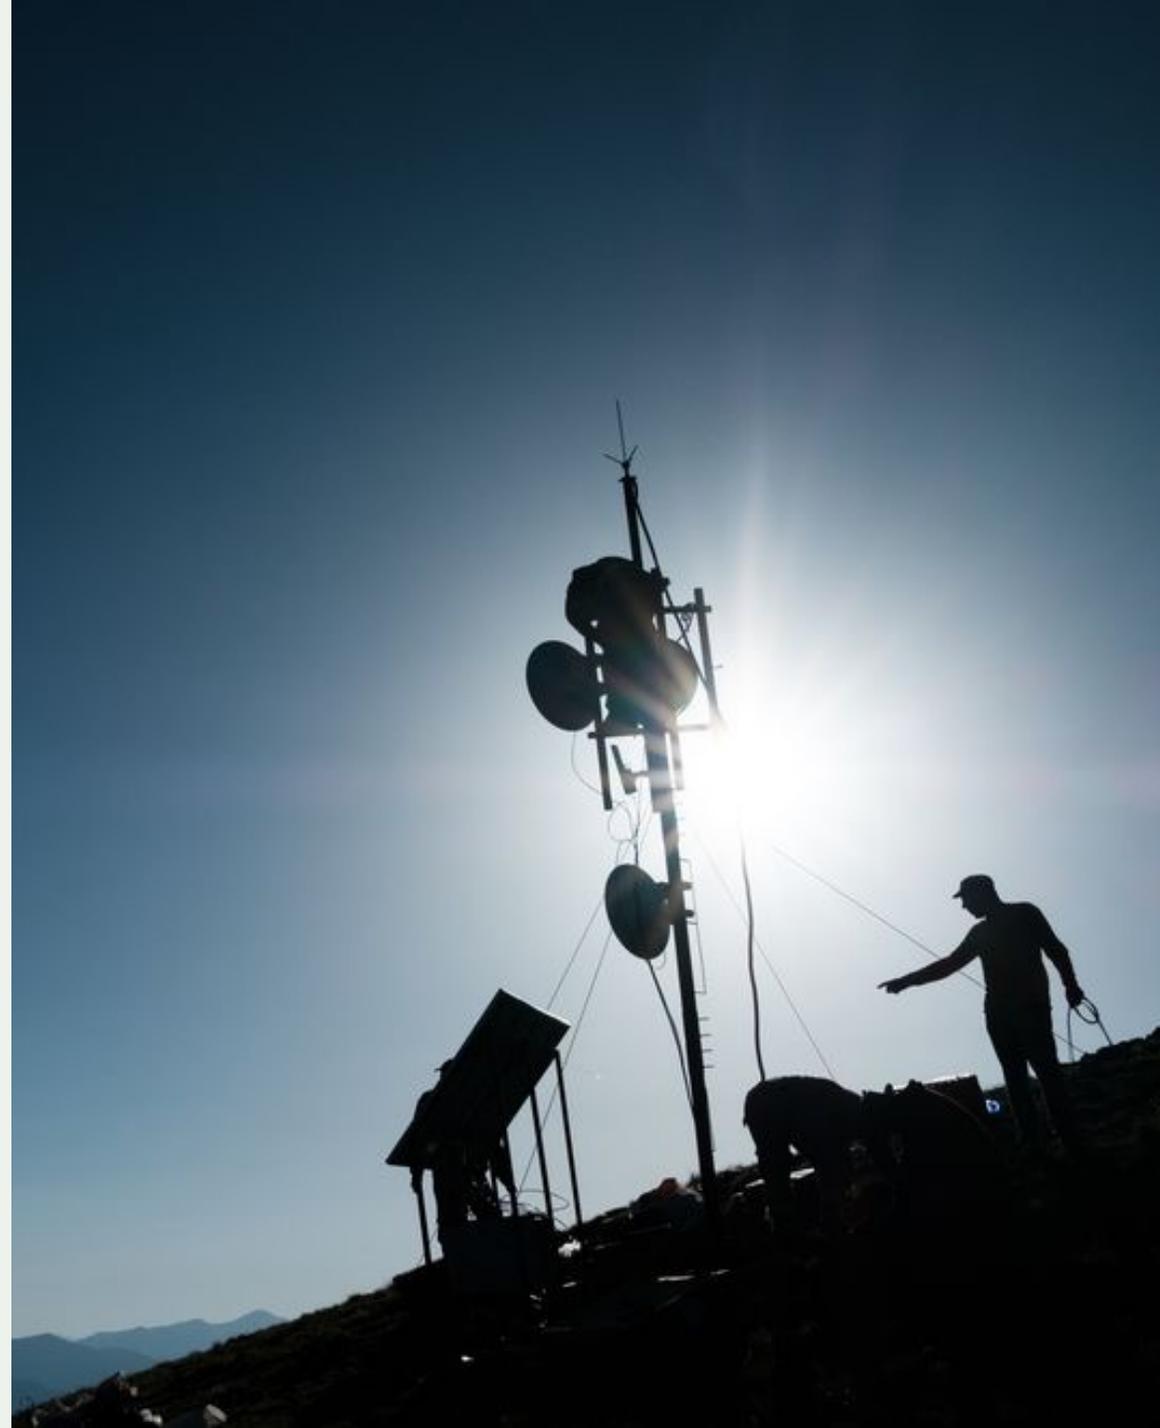

Michuki Mwangi
Distinguished Technologist - Internet Growth
mwangi@isoc.org

The Connectivity Challenge

Nearly **3 Billion people** are still offline

Internet growth is **slowing down**

We need **innovative and complementary** access solutions to connect those who need it the most.

Community Networks

Networks built by, and for, the communities they serve -
In a very practical sense, they happen when a community comes together and builds local infrastructure that then connects to the rest of the Internet.

Complementary Access Solutions - They reach areas that complement the work of traditional telecommunications operators. And they often partner with these operators to work together on connecting the local network to the rest of the Internet.

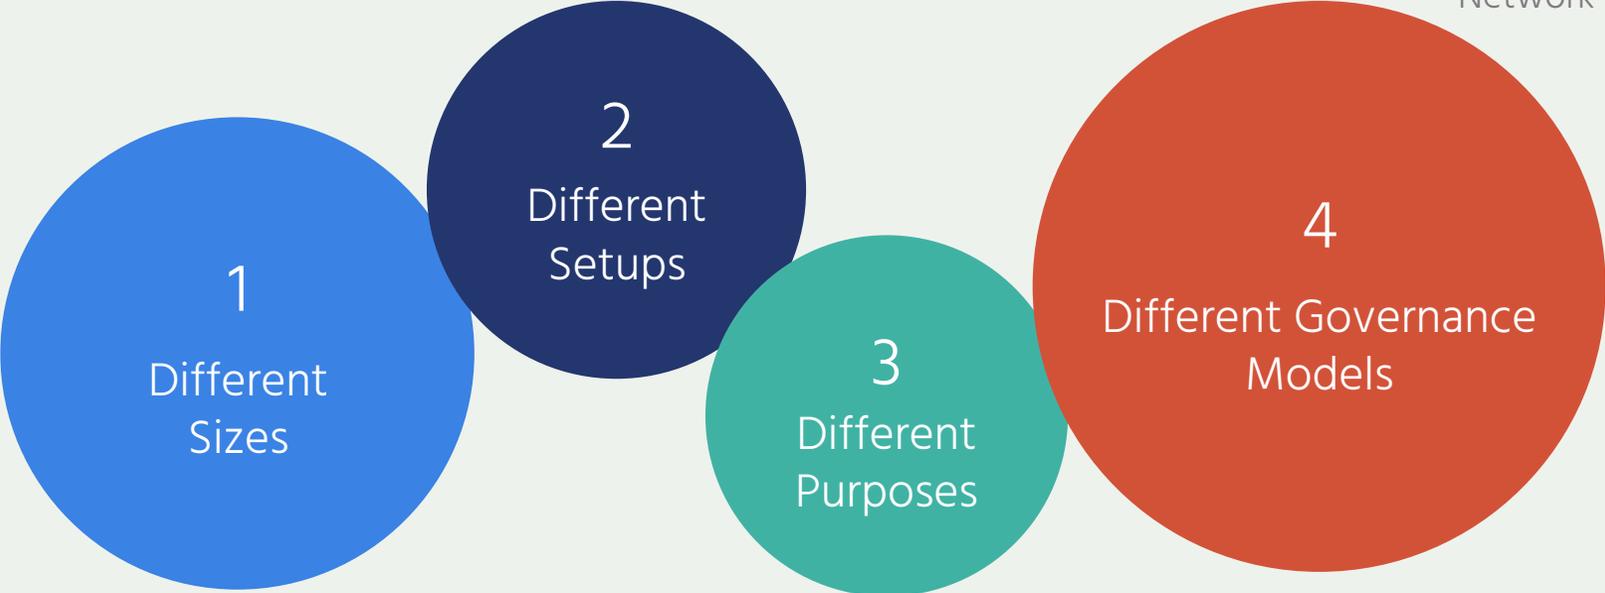

Rely on Local Champions and Partners – Community networks are possible through the initiative of people in the community, and partners that can support them.

Networks Designed to Address a Community's Needs

Non-profit member associations
Cooperatives
Small Businesses
Projects and partnership between government
NGOs
Internet Technical Community
Network operators and Academia

Voice and SMS only
WiFi only
Mesh Network
Municipal Network

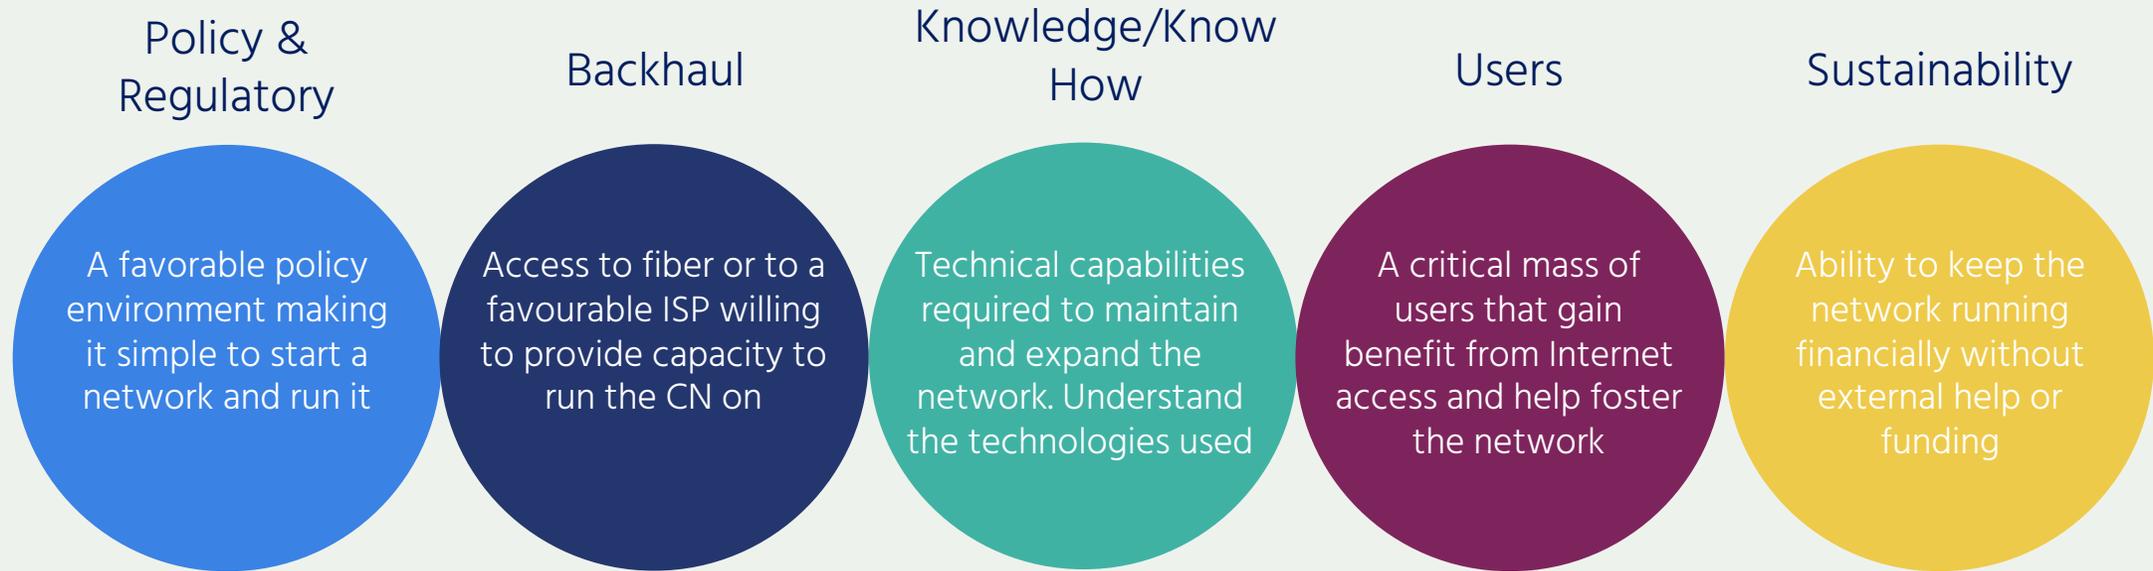

50 to 50000 users/people

Gain Access
Improve affordability
Greater openness, and
Autonomy

The Pillars of Community Networks

The Challenges Community Networks Face

Financial

Financial support
Backhaul costs
Equipment costs
Sustainability
Licenses costs
Scaling

Technical

Technical knowledge
Access to backhaul
Access to electricity
Open-Source Solutions

Regulatory

Spectrum licensing
Recognition from regulators
Access to universal service funds

Open-Source Solutions for CNs

- Network Management
 - A number of stable and well developed open-source tools available for bandwidth, network and device monitoring i.e LibreNMS, Nagios, MRTG, etc
- Authentication and Accounting Solutions (Billing)
 - Good AAA solution (FreeRadius)
 - Limited well-developed graphical user interfaces solutions for radius

Why is billing important for CNs?

- Billing is the ability for CNs to authenticate and account for usage on the network
- Billing generates revenue to maintain their day-to-day operations.
- Revenues are needed to scale growth and connect more users beyond the initial deployment phase.
- Revenues improve sustainability and reduce dependence on grants and donations.

CN Open-Source Billing Solution Requirements

- Support for Radius, PPOE, L2tP, Hotspot, etc
- Simplified graphical user interface
- Ease of deployment – low to middle level sysadmin experience
- Deployment on low power hardware – i.e Raspberry pi
- Support for configurable pre-paid and post-paid billing packages
- Reports and stats options
- Community of support – including other CNs

We are looking for an open source
billing solutions that we can
recommend to CNs.

2022 Project Focus

*New Deployments and
Improvements*

10 new or
improved
community
networks

Training

New training
courses and over
300 people
trained.

*Advocate for an Enabling
Policy Environment*

Fostering policies
and regulations
that enable CNs

Thank you.
