Kai-Steffen Hielscher

Reinhard German

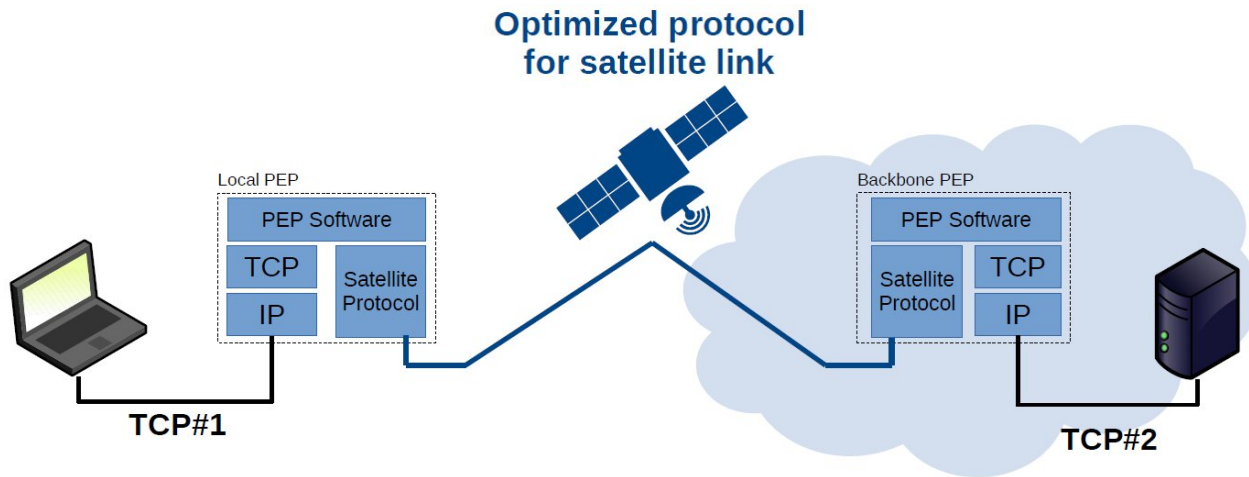

Supported by:

on the basis of a decision
by the German Bundestag

Motivation

- Performance Enhancing Proxies not applicable with QUIC

- Poor performance of QUIC over geostationary satellite links
 - [draft-jones-tsvwg-transport-for-satellite](#), previous maprg meetings
 - [Literature overview](#)
 - So far: **tests with specifically selected QUIC implementations**

Motivation

- QUIC Interop Runner <https://interop.seemann.io>

The screenshot shows the QUIC Interop Runner web interface. At the top, it displays the title "QUIC Interop Runner" and the URL "https://interop.seemann.io". Below this, there are fields for "Run:" (2022-03-17T00:25), "Start Time:" (3/17/2022 12:25:48 AM UTC), "Duration:" (05:09:12), and "End Time:" (3/17/2022 5:35:00 AM UTC). A red banner on the right says "Fork me on GitHub".

The main section is titled "Interop Status" and contains a table with 15 columns representing different QUIC implementations: quic-go, ngtcp2, quant, mvfst, quiche, kwik, picoquic, aioquic, nego, ngx, msquic, xquic, lsquic, haproxy, quinn, and s2n-quic. The table has 4 rows, each representing a test scenario. Each cell in the table contains a grid of colored icons (H, DC, LR, M, S, R, Z, B, U, A, L1, L2, C1, C2, E, A) representing test results for various QUIC features.

	quic-go	ngtcp2	quant	mvfst	quiche	kwik	picoquic	aioquic	nego	ngx	msquic	xquic	lsquic	haproxy	quinn	s2n-quic
quic-go	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]
ngtcp2	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]
quant	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]
mvfst	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]	[Icons]

Motivation

- QUIC Interop Runner

<https://interop.seemann.io>

- Several interop tests
- Performance tests
 - Bulk data transfer, symmetrical links, 10 Mbit/s, 30ms RTT, no packet loss
 - **GOODPUT** (good results for almost all implementations)
 - **CROSSTRAFFIC** with one competing TCP flow (results show significant unfairness)

- QUIC Interop Runner Satellite Edition

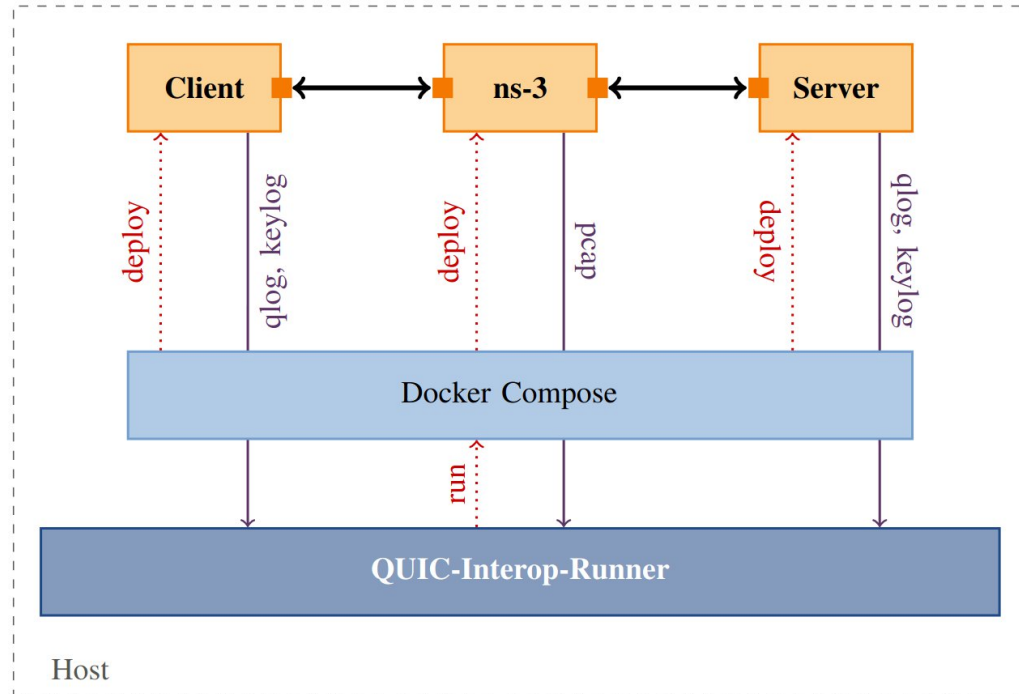

<https://interop.cs7.tf.fau.de>

- Added performance tests
- Modified architecture includes real satellite links
- Generation of time-offset graphs

Name	RTT	Link Rate	PLR
	[ms]	[Mbit/s]	[%]
TERR.	30	20/2	0
SAT	600	20/2	0
SATLOSS	600	20/2	1
ASTRA	≈ 600	20/2	≈ 0.1
EUTELSAT	≈ 600	50/5	≈ 0.1

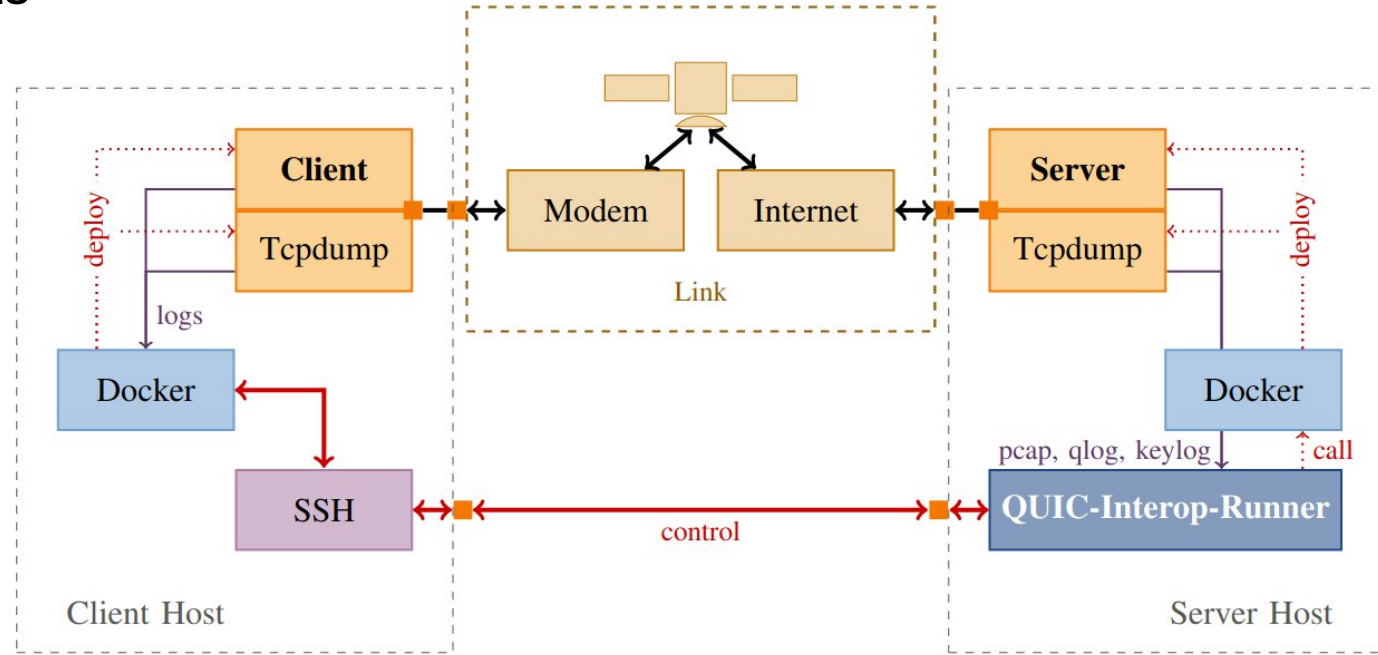

Architecture and Setup (original QUIC Interop Runner)

- Docker containers on single host machine
- ns-3 link emulation
- Performance tests with emulated links
 - **TERRESTRIAL**
 - **SAT**
 - **SATLOSS**
- 10 iterations per QUIC client/server combination

Architecture and Setup (modified for real satellite links)

- Distributed setup
- Performance tests with real links
 - **ASTRA**
 - **EUTELSAT**
- Single vantage point
- 5 iterations per QUIC client/server combination

SAT

(20/2 Mbit/s, 600ms RTT, no packet loss)

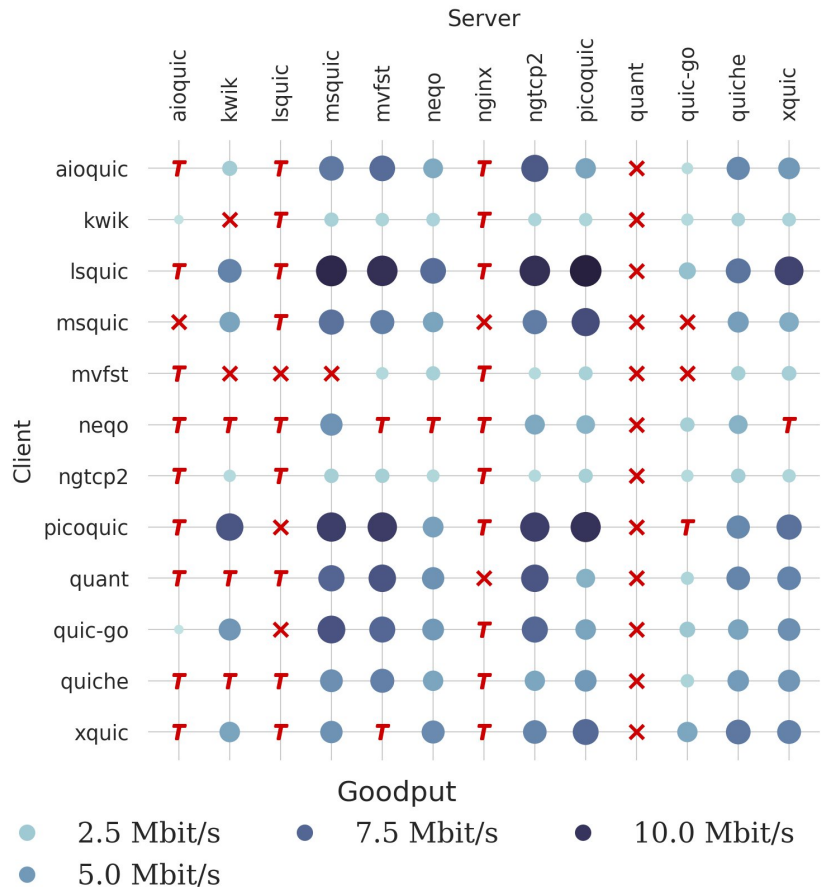

SATLOSS

(20/2 Mbit/s, 600ms RTT, 1% packet loss)

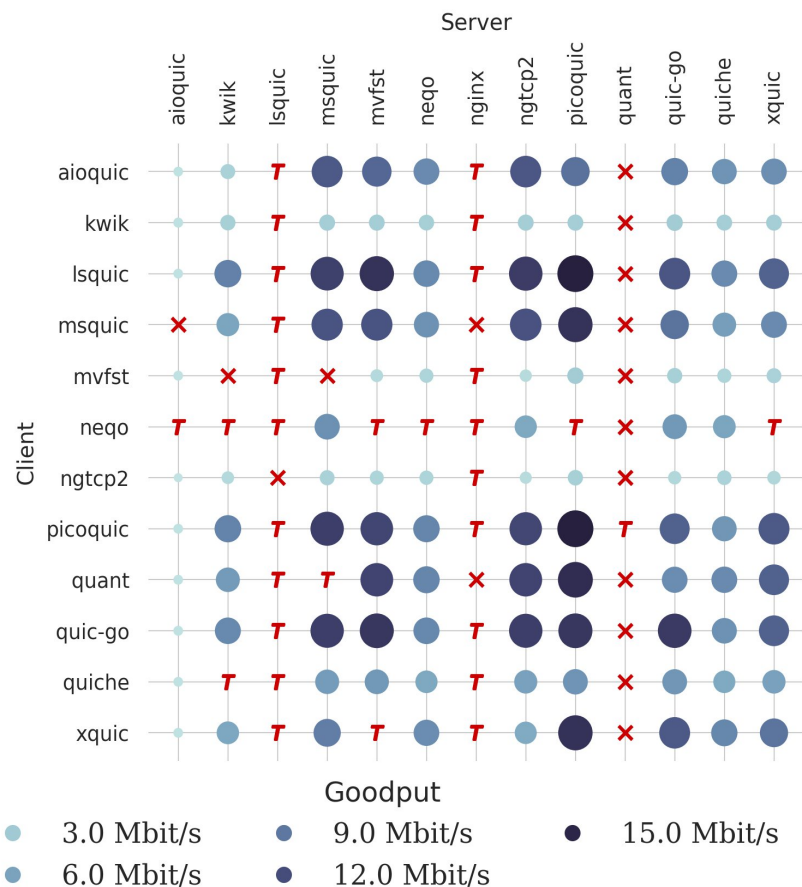

ASTRA

(real satellite link, 20/2 Mbit/s)

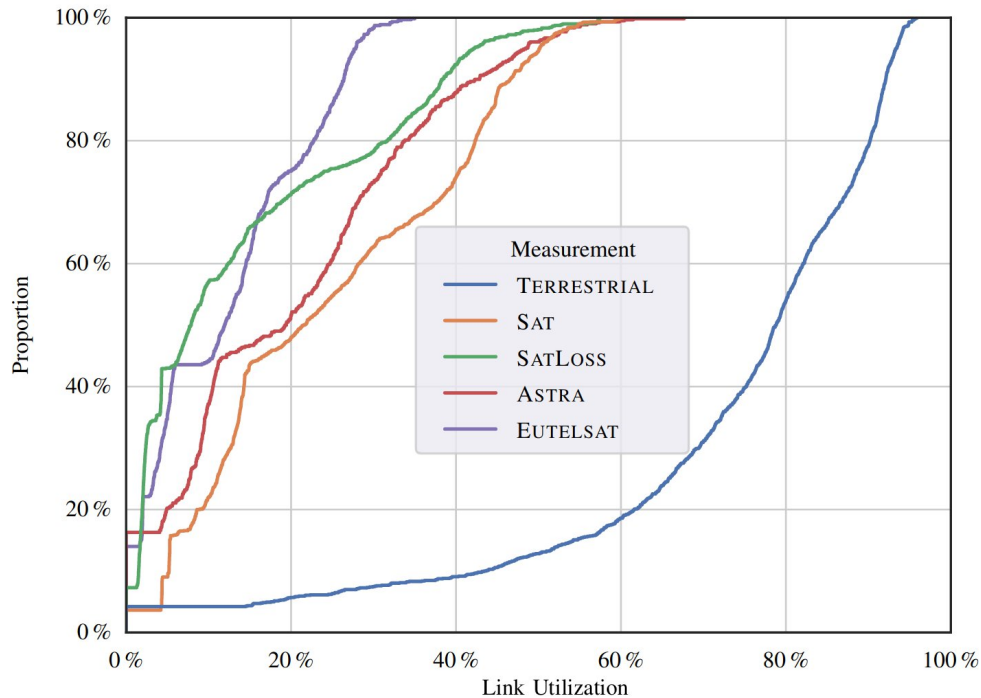

EUTELSAT

(real satellite link, 50/5 Mbit/s)

Results Overview

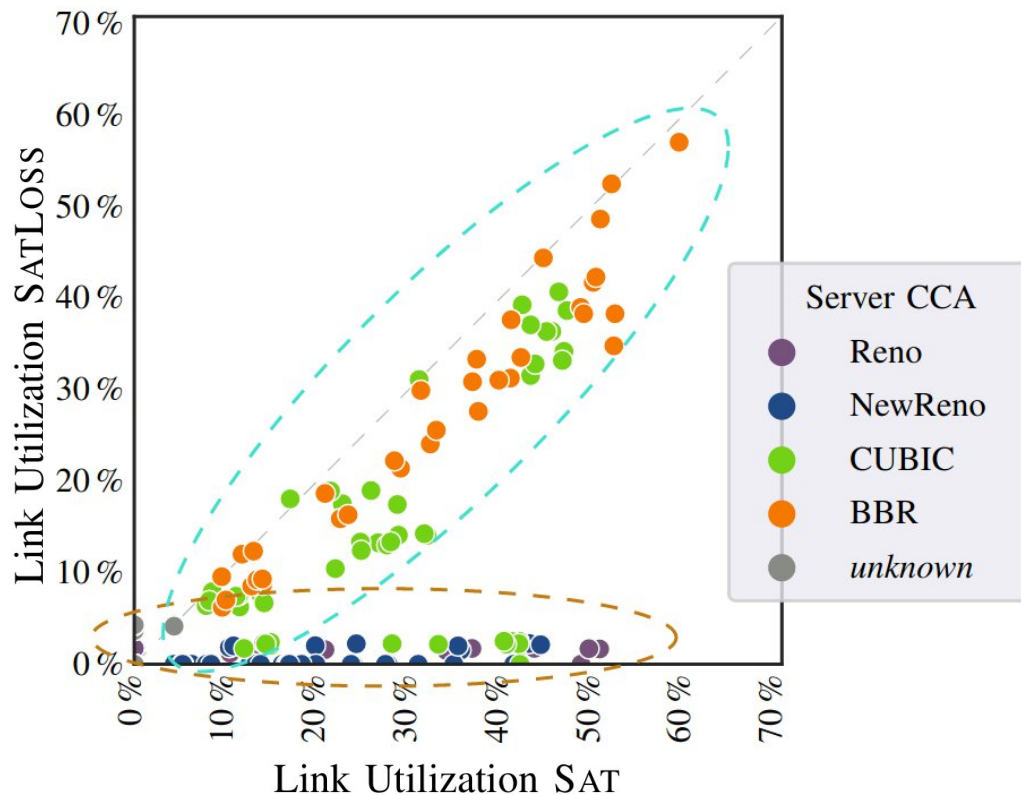

$$\text{Link Utilization} = \frac{\text{Goodput}}{\text{Link Data Rate}}$$

Name	RTT [ms]	Link Rate [Mbit/s]	PLR [%]
TERR.	30	20/2	0
SAT	600	20/2	0
SATLOSS	600	20/2	1
ASTRA	≈ 600	20/2	≈ 0.1
EUTELSAT	≈ 600	50/5	≈ 0.1

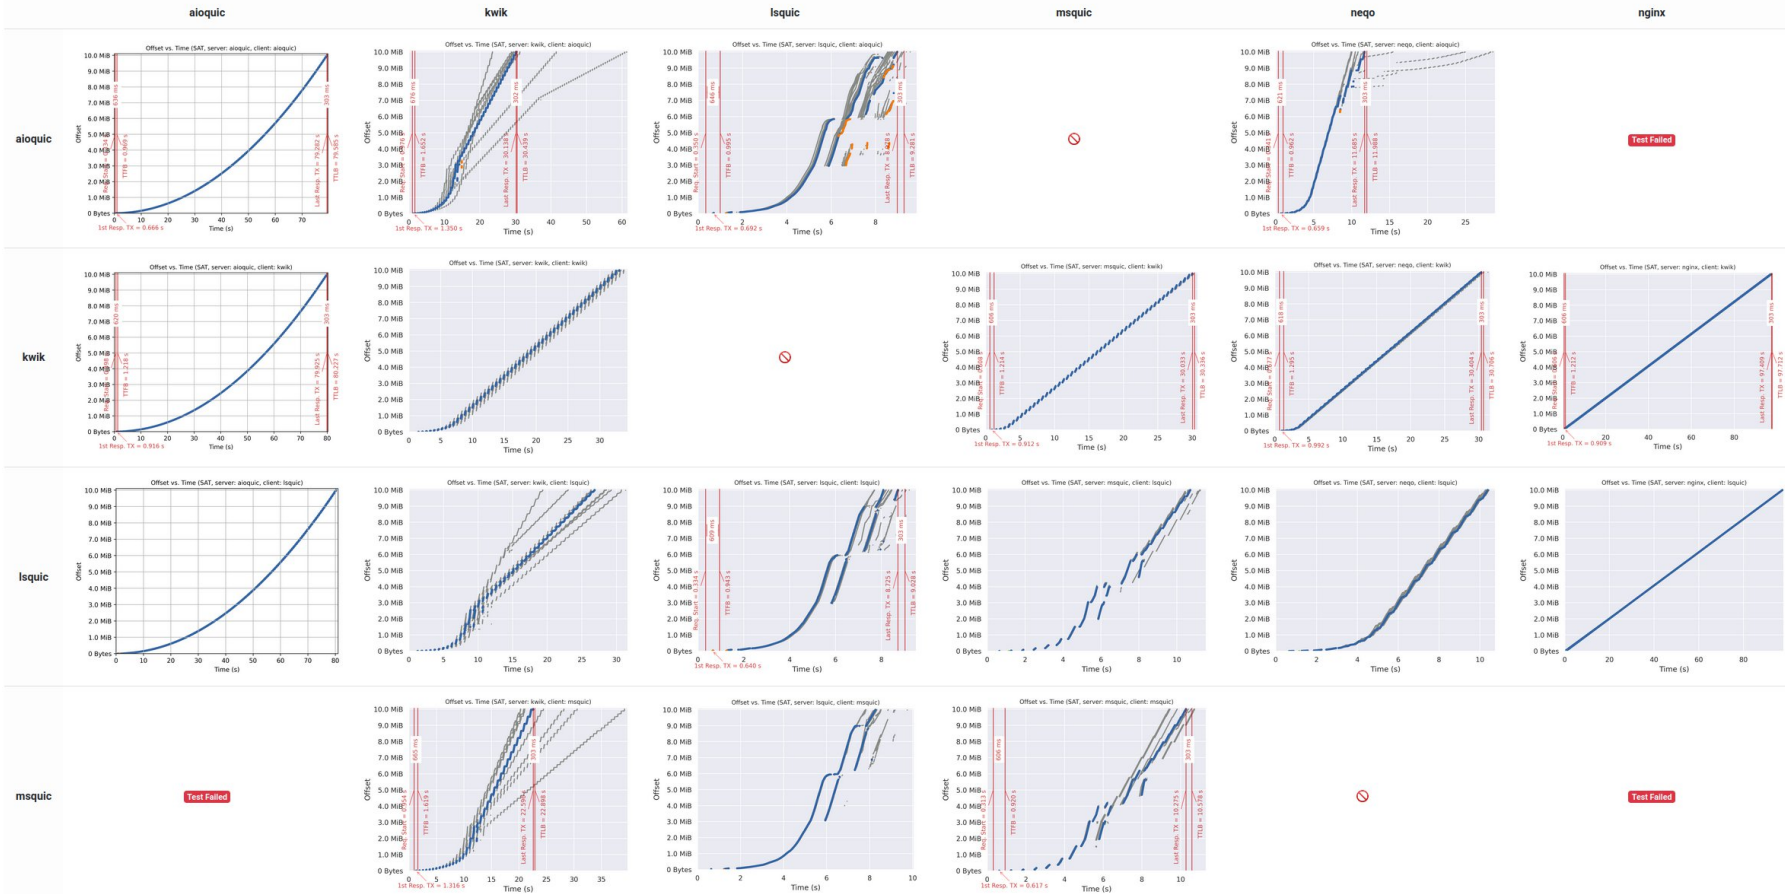

Measurement	Mean [Mbit/s]	Max [Mbit/s]	Time-out T [%]	Failed \times [%]
TERR.	15.11	19.2	12	1
SAT	5.05	12.0	3	6
SATLOSS	3.06	11.5	13	17
ASTRA	4.91	13.5	23	15
EUTELSAT	6.98	17.5	20	11

Influence of CC Algorithm

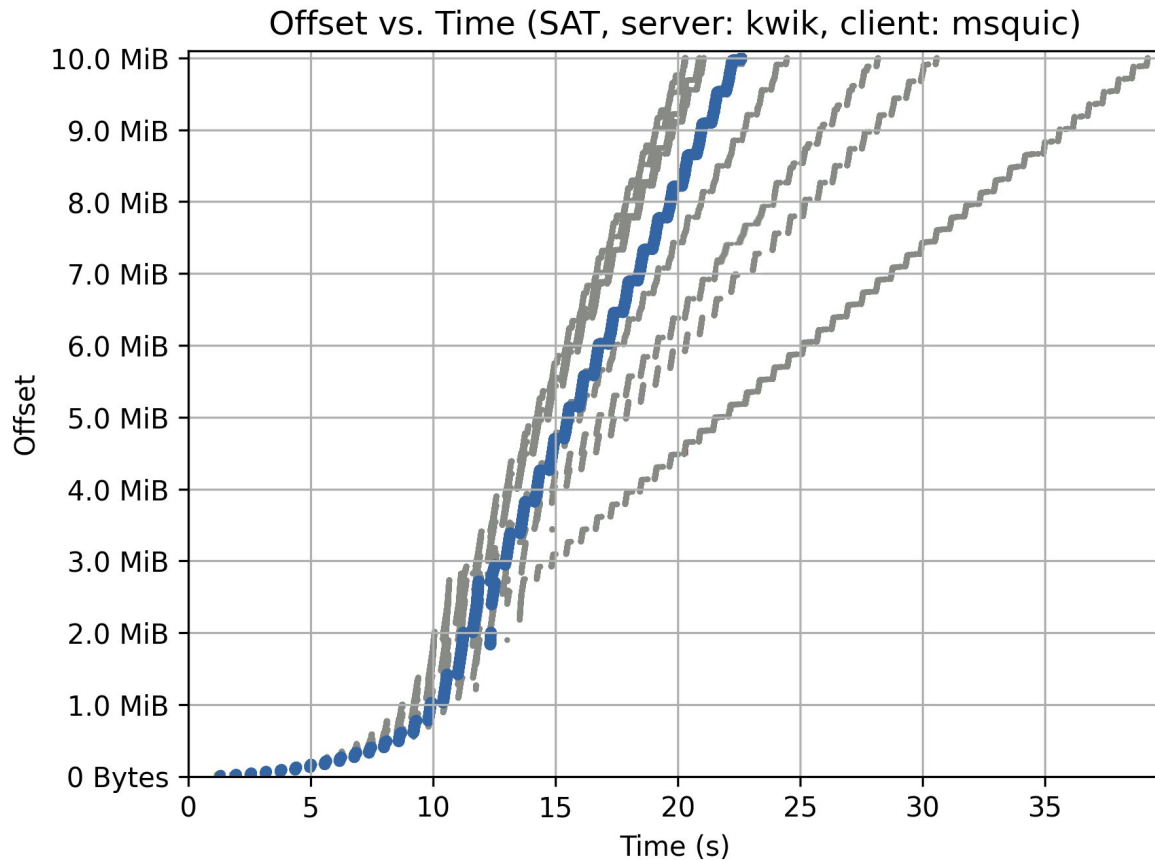

Name	CCA	HyStart
<i>aiouic</i>	NewReno	✗
<i>chrome</i>	BBRv2, CUBIC	✓
<i>kwik</i>	NewReno	✗
<i>lsquic</i>	BBR , CUBIC	✗
<i>msquic</i>	CUBIC	✗
<i>myfst</i>	BBR , CUBIC, NewReno, ...	✓
<i>neqo</i>	CUBIC, NewReno	✗
<i>nginx</i>	⊙	✗
<i>ngtcp2</i>	BBRv2, BBR, CUBIC, Reno	✗
<i>picoquic</i>	BBR , CUBIC	✓
<i>quant</i>	NewReno	✗
<i>quic-go</i>	CUBIC ⊙, Reno ⊙	✗
<i>quiche</i>	CUBIC	✓
<i>quicly</i>	CUBIC, Reno , pico	✗
<i>xquic</i>	BBR , CUBIC, Reno	✗

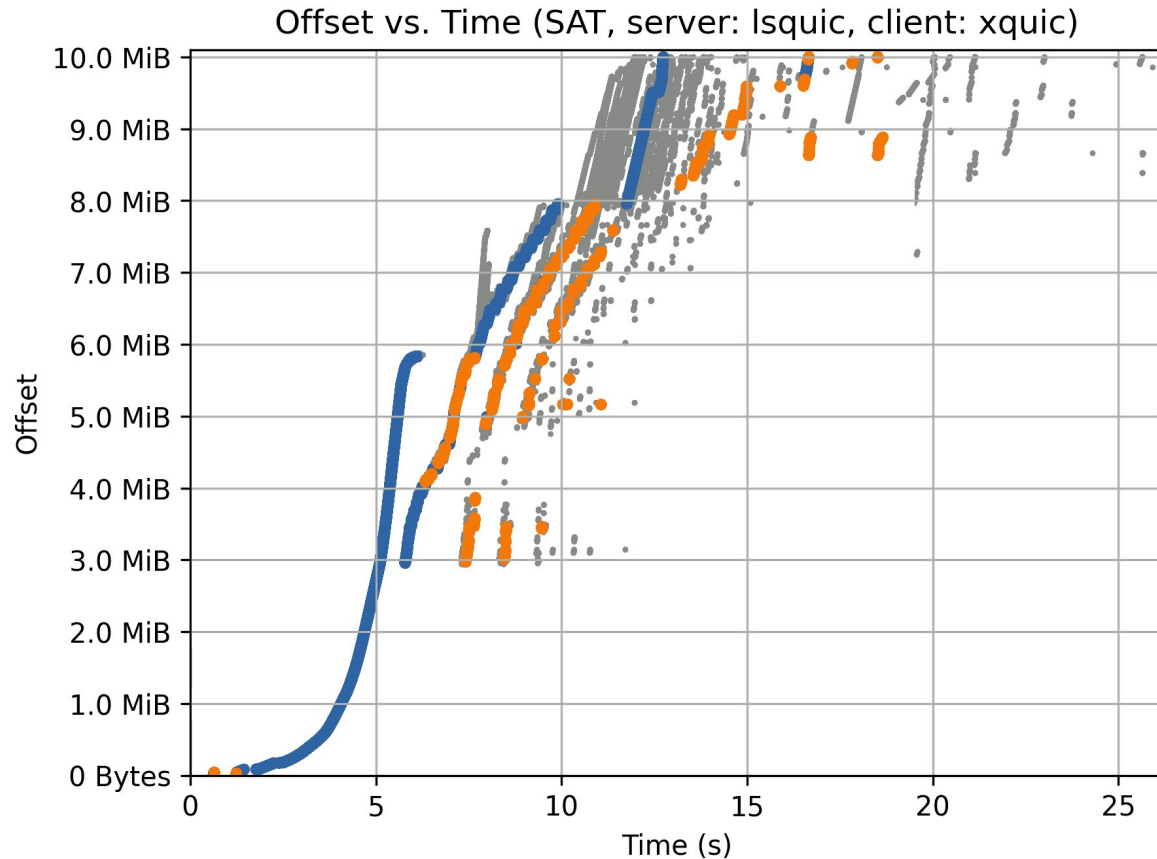

Time-Offset Diagrams

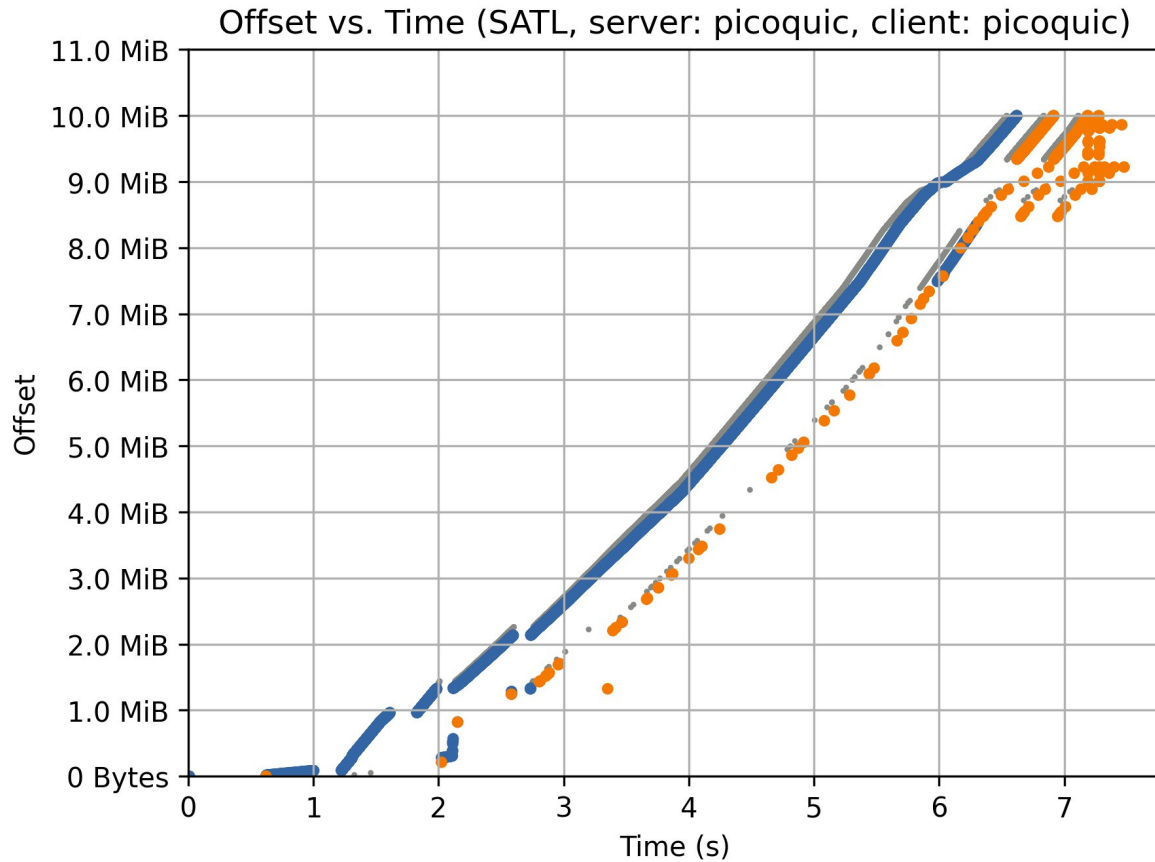

kwik (server) – msquic (client) – SAT (no loss)

Isquic (server) – xquic (client) – SAT (no loss)

picoquic (server) – picoquic (client) – SATLOSS (1% loss)

msquic (server) – xquic (client) – SATLOSS (1% loss)

- Modified QUIC Interop Runner
 - Emulated satellite links and real satellite operators
 - Generation of time-offset diagrams
- QUIC + geostationary satellites: very poor performance in general
 - Worse with packet loss – CUBIC and BBR better than (New)Reno
 - Performance depends on both client and server
 - Implementations probably not optimized for such link characteristics
 - Hard to debug each and every implementation / combination
- Next steps
 - More detailed analysis (e.g., influence of flow control)
 - Additional test scenarios and long term measurements
 - Discussion on EToSat mailing list
