IETF-113  Mar 2022, Vienna
Path Segment definition

- As defined in [I-D.ietf-spring-mpls-path-segment], the Path Segment is normally used by the egress nodes for path identification
- Path Segment MUST be inserted at the ingress node
- Path Segment MUST NOT be popped off until it reaches the egress node
Intention of this draft

• Provides definition of Target FEC sub-TLVs for Path Segment

• As defined in [I-D.ietf-spring-mpls-path-segment], the Path Segment may be used to identify an SR Policy, its Candidate Path, or a Segment List
  – Target FEC SR Policy's Path SID sub-TLV
  – Target FEC SR Candidate Path's Path SID sub-TLV
  – Target FEC SR Segment List's Path SID sub-TLV
An SR Policy MUST be identified through the tuple <headend, color, endpoint> (as specified in [I-D.ietf-spring-segment-routing-policy])

When the Path Segment is used to identify an SR Policy, this Target FEC sub-TLV would be included in the LSP Ping message
SR Candidate Path's Path SID sub-TLV

- An SR Candidate Path MUST be identified through the tuple <headend, color, endpoint, protocol-origin, originator, discriminator> (as specified in [I-D.ietf-spring-segment-routing-policy])
- When the Path Segment is used to identify an SR Candidate Path, this Target FEC sub-TLV would be included in the LSP Ping message
SR Segment List's Path SID sub-TLV

- An SR Segment List can be identified through the tuple < headend, color, endpoint, protocol-origin, originator, discriminator, segment-list-id >
- When the Path Segment is used to identify an SR Segment List, this Target FEC sub-TLV would be included in the LSP Ping message
Next step

• WG adoption?

Thank you!
