List Pagination for YANG-driven Protocols  
draft-ietf-netconf-list-pagination-00

Abstract

In some circumstances, instances of YANG modeled "list" and "leaf-list" nodes may contain numerous entries. Retrieval of all the entries can lead to inefficiencies in the server, the client, and the network in between.

This document defines a model for list pagination that can be implemented by YANG-driven management protocols such as NETCONF and RESTCONF. The model supports paging over optionally filtered and/or sorted entries. The solution additionally enables servers to constrain query expressions on some "config false" lists or leaf-lists.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 25 January 2023.

## 1. Introduction

YANG modeled "list" and "leaf-list" nodes may contain a large number of entries. For instance, there may be thousands of entries in the configuration for network interfaces or access control lists. And time-driven logging mechanisms, such as an audit log or a traffic log, can contain millions of entries.

Retrieval of all the entries can lead to inefficiencies in the server, the client, and the network in between. For instance, consider the following:

- \* A client may need to filter and/or sort list entries in order to, e.g., present the view requested by a user.
- \* A server may need to iterate over many more list entries than needed by a client.
- \* A network may need to convey more data than needed by a client.

Optimal global resource utilization is obtained when clients are able to cherry-pick just that which is needed to support the application-level business logic.

This document defines a generic model for list pagination that can be implemented by YANG-driven management protocols such as NETCONF [RFC6241] and RESTCONF [RFC8040]. Details for how such protocols are updated are outside the scope of this document.

The model presented in this document supports paging over optionally filtered and/or sorted entries. Server-side filtering and sorting is ideal as servers can leverage indexes maintained by a backend storage layer to accelerate queries.

### 1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [RFC2119] [RFC8174] when, and only when, they appear in all capitals, as shown here.

The following terms are defined in [RFC7950] and are not redefined here: client, data model, data tree, feature, extension, module, leaf, leaf-list, and server.

### 1.2. Conventions

Various examples used in this document use a placeholder value for binary data that has been base64 encoded (e.g., "BASE64VALUE="). This placeholder value is used as real base64 encoded structures are often many lines long and hence distracting to the example being presented.

### 1.3. Adherence to the NMDA

This document is compliant with the Network Management Datastore Architecture (NMDA) [RFC8342]. The "ietf-list-pagination" module only defines a YANG extension and augments a couple leafs into a "config false" node defined by the "ietf-system-capabilities" module.

## 2. Solution Overview

The solution presented in this document broadly entails a client sending a query to a server targeting a specific list or leaf-list including optional parameters guiding which entries should be returned.

A secondary aspect of this solution entails a client sending a query parameter to a server guiding how descendent lists and leaf-lists should be returned. This parameter may be used on any target node, not just "list" and "leaf-list" nodes.

Clients detect a server's support for list pagination via an entry for the "ietf-list-pagination" module (defined in Section 4) in the server's YANG Library [RFC8525] response.

Relying on client-provided query parameters ensures servers remain backward compatible with legacy clients.

### 3. Solution Details

This section is composed of the following subsections:

- \* Section 3.1 defines five query parameters clients may use to page through the entries of a single list or leaf-list in a data tree.
- \* Section 3.2 defines one query parameter that clients may use to affect the content returned for descendant lists and leaf-lists.
- \* Section 3.3 defines per schema-node tags enabling servers to indicate which "config false" lists are constrained and how they may be interacted with.

#### 3.1. Query Parameters for a Targeted List or Leaf-List

The five query parameters presented this section are listed in processing order. This processing order is logical, efficient, and matches the processing order implemented by database systems, such as SQL.

The order is as follows: a server first processes the "where" parameter (see Section 3.1.1), then the "sort-by" parameter (see Section 3.1.2), then the "direction" parameter (see Section 3.1.3), then the "offset" parameter (see Section 3.1.4), and lastly the "limit" parameter (see Section 3.1.5).

##### 3.1.1. The "where" Query Parameter

###### Description

The "where" query parameter specifies a filter expression that result-set entries must match.

###### Default Value

If this query parameter is unspecified, then no entries are filtered from the working result-set.

###### Allowed Values

The allowed values are XPath 1.0 expressions. It is an error if the XPath expression references a node identifier that does not exist in the schema, is optional or conditional in the schema or, for constrained "config false" lists and leaf-lists (see Section 3.3), if the node identifier does not point to a node having the "indexed" extension statement applied to it (see Section 3.3.2).

#### Conformance

The "where" query parameter MUST be supported for all "config true" lists and leaf-lists and SHOULD be supported for "config false" lists and leaf-lists. Servers MAY disable the support for some or all "config false" lists and leaf-lists as described in Section 3.3.2.

### 3.1.2. The "sort-by" Query Parameter

#### Description

The "sort-by" query parameter indicates the node in the working result-set (i.e., after the "where" parameter has been applied) that entries should be sorted by. Sorts are in ascending order (e.g., '1' before '9', 'a' before 'z', etc.). Missing values are sorted to the end (e.g., after all nodes having values). Sub-sorts are not supported.

#### Default Value

If this query parameter is unspecified, then the list or leaf-list's default order is used, per the YANG "ordered-by" statement (see Section 7.7.7 of [RFC7950]).

#### Allowed Values

The allowed values are node identifiers. It is an error if the specified node identifier does not exist in the schema, is optional or conditional in the schema or, for constrained "config false" lists and leaf-lists (see Section 3.3), if the node identifier does not point to a node having the "indexed" extension statement applied to it (see Section 3.3.2).

#### Conformance

The "sort-by" query parameter MUST be supported for all "config true" lists and leaf-lists and SHOULD be supported for "config false" lists and leaf-lists. Servers MAY disable the support for some or all "config false" lists and leaf-lists as described in Section 3.3.2.

### 3.1.3. The "direction" Query Parameter

#### Description

The "direction" query parameter indicates how the entries in the working result-set (i.e., after the "sort-by" parameter has been applied) should be traversed.

#### Default Value

If this query parameter is unspecified, the default value is "forwards".

#### Allowed Values

The allowed values are:

##### forwards

Return entries in the forwards direction. Also known as the "default" or "ascending" direction.

##### backwards

Return entries in the backwards direction. Also known as the "reverse" or "descending" direction

#### Conformance

The "direction" query parameter MUST be supported for all lists and leaf-lists.

### 3.1.4. The "offset" Query Parameter

#### Description

The "offset" query parameter indicates the number of entries in the working result-set (i.e., after the "direction" parameter has been applied) that should be skipped over when preparing the response.

#### Default Value

If this query parameter is unspecified, then no entries in the result-set are skipped, same as when the offset value '0' is specified.

#### Allowed Values

The allowed values are unsigned integers. It is an error for the offset value to exceed the number of entries in the working result-set, and the "offset-out-of-range" identity SHOULD be produced in the error output when this occurs.

#### Conformance

The "offset" query parameter MUST be supported for all lists and leaf-lists.

### 3.1.5. The "limit" Query Parameter

#### Description

The "limit" query parameter limits the number of entries returned from the working result-set (i.e., after the "offset" parameter has been applied). Any list or leaf-list that is limited includes, somewhere in its encoding, a metadata value [RFC7952] called "remaining", a positive integer indicating the number of elements that were not included in the result-set by the "limit" operation, or the value "unknown" in case, e.g., the server

determines that counting would be prohibitively expensive.

#### Default Value

If this query parameter is unspecified, the number of entries that may be returned is unbounded.

#### Allowed Values

The allowed values are positive integers.

#### Conformance

The "limit" query parameter MUST be supported for all lists and leaf-lists.

### 3.2. Query Parameter for Descendant Lists and Leaf-Lists

Whilst this document primarily regards pagination for a list or leaf-list, it begs the question for how descendant lists and leaf-lists should be handled, which is addressed by the "sublist-limit" query parameter described in this section.

#### 3.2.1. The "sublist-limit" Query Parameter

##### Description

The "sublist-limit" parameter limits the number of entries returned for descendent lists and leaf-lists.

Any descendent list or leaf-list limited by the "sublist-limit" parameter includes, somewhere in its encoding, a metadata value [RFC7952] called "remaining", a positive integer indicating the number of elements that were not included by the "sublist-limit" parameter, or the value "unknown" in case, e.g., the server determines that counting would be prohibitively expensive.

When used on a list node, it only affects the list's descendant nodes, not the list itself, which is only affected by the parameters presented in Section 3.1.

##### Default Value

If this query parameter is unspecified, the number of entries that may be returned for descendent lists and leaf-lists is unbounded.

##### Allowed Values

The allowed values are positive integers.

##### Conformance

The "sublist-limit" query parameter MUST be supported for all conventional nodes, including a datastore's top-level node (i.e., '/').

### 3.3. Constraints on "where" and "sort-by" for "config false" Lists

Some "config false" lists and leaf-lists may contain an enormous number of entries. For instance, a time-driven logging mechanism, such as an audit log or a traffic log, can contain millions of entries.

In such cases, "where" and "sort-by" expressions will not perform well if the server must bring each entry into memory in order to process it.

The server's best option is to leverage query-optimizing features (e.g., indexes) built into the backend database holding the dataset.

However, arbitrary "where" expressions and "sort-by" node identifiers into syntax supported by the backend database and/or query-optimizers may prove challenging, if not impossible, to implement.

Thusly this section introduces mechanisms whereby a server can:

1. Identify which "config false" lists and leaf-lists are constrained.
2. Identify what node-identifiers and expressions are allowed for the constrained lists and leaf-lists.

Note: The pagination performance for "config true" lists and leaf-lists is not considered as already servers must be able to process them as configuration. Whilst some "config true" lists and leaf-lists may contain thousands of entries, they are well within the capability of server-side processing.

#### 3.3.1. Identifying Constrained "config false" Lists and Leaf-Lists

Identification of which lists and leaf-lists are constrained occurs in the schema tree, not the data tree. However, as server abilities vary, it is not possible to define constraints in YANG modules defining generic data models.

In order to enable servers to identify which lists and leaf-lists are constrained, the solution presented in this document augments the data model defined by the "ietf-system-capabilities" module presented in [I-D.ietf-netconf-notification-capabilities].

Specifically, the "ietf-list-pagination" module (see Section 4) augments an empty leaf node called "constrained" into the "per-node-capabilities" node defined in the "ietf-system-capabilities" module.

The "constrained" leaf MAY be specified for any "config false" list or leaf-list.

When a list or leaf-list is constrained:

- \* All parts of XPath 1.0 expressions are disabled unless explicitly enabled by Section 3.3.2.
- \* Node-identifiers used in "where" expressions and "sort-by" filters MUST have the "indexed" leaf applied to it (see Section 3.3.2).
- \* For lists only, node-identifiers used in "where" expressions and "sort-by" filters MUST NOT descend past any descendent lists. This ensures that only indexes relative to the targeted list are used. Further constraints on node identifiers MAY be applied in Section 3.3.2.

### 3.3.2. Indicating the Constraints for "where" Filters and "sort-by" Expressions

This section identifies how constraints for "where" filters and "sort-by" expressions are specified. These constraints are valid only if the "constrained" leaf described in the previous section Section 3.3.1 has been set on the immediate ancestor "list" node or, for "leaf-list" nodes, on itself.

#### 3.3.2.1. Indicating Filterable/Sortable Nodes

For "where" filters, an unconstrained XPath expressions may use any node in comparisons. However, efficient mappings to backend databases may support only a subset of the nodes.

Similarly, for "sort-by" expressions, efficient sorts may only support a subset of the nodes.

In order to enable servers to identify which nodes may be used in comparisons (for both "where" and "sort-by" expressions), the "ietf-list-pagination" module (see Section 4) augments an empty leaf node called "indexed" into the "per-node-capabilities" node defined in the "ietf-system-capabilities" module (see [I-D.ietf-netconf-notification-capabilities]).

When a "list" or "leaf-list" node has the "constrained" leaf, only nodes having the "indexed" node may be used in "where" and/or "sort-by" expressions. If no nodes have the "indexed" leaf, when the "constrained" leaf is present, then "where" and "sort-by" expressions are disabled for that list or leaf-list.

#### 4. The "ietf-list-pagination" Module

The "ietf-list-pagination" module is used by servers to indicate that they support pagination on YANG "list" and "leaf-list" nodes, and to provide an ability to indicate which "config false" list and/or "leaf-list" nodes are constrained and, if so, which nodes may be used in "where" and "sort-by" expressions.

##### 4.1. Data Model Overview

The following tree diagram [RFC8340] illustrates the "ietf-list-pagination" module:

```
module: ietf-list-pagination
```

```
  augment /sysc:system-capabilities/sysc:datastore-capabilities
    /sysc:per-node-capabilities:
      +--ro constrained?  empty
      +--ro indexed?     empty
```

Comments:

- \* As shown, this module augments two optional leaves into the "node-selector" node of the "ietf-system-capabilities" module.
- \* Not shown is that the module also defines an "md:annotation" statement named "remaining". This annotation may be present in a server's response to a client request containing either the "limit" (Section 3.1.5) or "sublist-limit" parameters (Appendix A.3.6).

##### 4.2. Example Usage

###### 4.2.1. Constraining a "config false" list

The following example illustrates the "ietf-list-pagination" module's augmentations of the "system-capabilities" data tree. This example assumes the "example-social" module defined in the Appendix A.1 is implemented.

===== NOTE: '\ ' line wrapping per RFC 8792 =====

```
<system-capabilities
  xmlns="urn:ietf:params:xml:ns:yang:ietf-system-capabilities"
  xmlns:ds="urn:ietf:params:xml:ns:yang:ietf-datastores"
  xmlns:es="http://example.com/ns/example-social"
  xmlns:lpg="urn:ietf:params:xml:ns:yang:ietf-list-pagination">
  <datastore-capabilities>
    <datastore>ds:operational</datastore>
    <per-node-capabilities>
      <node-selector>/es:audit-logs/es:audit-log</node-selector>
      <lpg:constrained/>
    </per-node-capabilities>
    <per-node-capabilities>
      <node-selector>/es:audit-logs/es:audit-log/es:timestamp</node-selector>
    </per-node-capabilities>
    <per-node-capabilities>
      <node-selector>/es:audit-logs/es:audit-log/es:member-id</node-selector>
    </per-node-capabilities>
    <per-node-capabilities>
      <node-selector>/es:audit-logs/es:audit-log/es:outcome</node-selector>
    </per-node-capabilities>
  </datastore-capabilities>
</system-capabilities>
```

#### 4.2.2. Indicating number remaining in a limited list

FIXME: valid syntax for 'where'?

#### 4.3. YANG Module

This YANG module has normative references to [RFC7952] and [I-D.ietf-netconf-notification-capabilities].

## 5. IANA Considerations

### 5.1. The "IETF XML" Registry

This document registers one URI in the "ns" subregistry of the IETF XML Registry [RFC3688] maintained at <https://www.iana.org/assignments/xml-registry/xml-registry.xhtml#ns>. Following the format in [RFC3688], the following registration is requested:

URI: urn:ietf:params:xml:ns:yang:ietf-list-pagination  
Registrant Contact: The IESG.  
XML: N/A, the requested URI is an XML namespace.

### 5.2. The "YANG Module Names" Registry

This document registers one YANG module in the YANG Module Names registry [RFC6020] maintained at <https://www.iana.org/assignments/yang-parameters/yang-parameters.xhtml>. Following the format defined in [RFC6020], the below registration is requested:

name: ietf-list-pagination  
namespace: urn:ietf:params:xml:ns:yang:ietf-list-pagination  
prefix: lpg  
RFC: XXXX

## 6. Security Considerations

### 6.1. Regarding the "ietf-list-pagination" YANG Module

Pursuant the template defined in ...FIXME

## Appendix A. Vector Tests

This normative appendix section illustrates every notable edge condition conceived during this document's production.

Test inputs and outputs are provided in a manner that is both generic and concise.

Management protocol specific documents need only reproduce as many of these tests as necessary to convey peculiarities presented by the protocol.

Implementations are RECOMMENDED to implement the tests presented in this document, in addition to any tests that may be presented in protocol specific documents.

### A.1. Example YANG Module

The vector tests assume the "example-social" YANG module defined in this section.

This module has been specially crafted to cover every notable edge condition, especially with regards to the types of the data nodes.

Following is the tree diagram [RFC8340] for the "example-social" module:

```

module: example-social
+--rw members
|   +--rw member* [member-id]
|   |   +--rw member-id          string
|   |   +--rw email-address      inet:email-address
|   |   +--rw password           ianach:crypt-hash
|   |   +--rw avatar?            binary
|   |   +--rw tagline?           string
|   |   +--rw privacy-settings
|   |   |   +--rw hide-network?   boolean
|   |   |   +--rw post-visibility? enumeration
|   |   +--rw following*        -> /members/member/member-id
|   +--rw posts
|   |   +--rw post* [timestamp]
|   |   |   +--rw timestamp      yang:date-and-time
|   |   |   +--rw title?        string
|   |   |   +--rw body          string
|   +--rw favorites
|   |   +--rw uint8-numbers*      uint8
|   |   +--rw uint64-numbers*     uint64
|   |   +--rw int8-numbers*       int8
|   |   +--rw int64-numbers*      int64
|   |   +--rw decimal64-numbers*  decimal64
|   |   +--rw bits*              bits
|   +--ro stats
|   |   +--ro joined              yang:date-and-time
|   |   +--ro membership-level    enumeration
|   |   +--ro last-activity?      yang:date-and-time
+--ro audit-logs
|   +--ro audit-log* []
|   |   +--ro timestamp          yang:date-and-time
|   |   +--ro member-id          string
|   |   +--ro source-ip          inet:ip-address
|   |   +--ro request            string
|   |   +--ro outcome            boolean

```

Following is the YANG [RFC7950] for the "example-social" module:

```

module example-social {
  yang-version 1.1;
  namespace "http://example.com/ns/example-social";
  prefix es;

  import ietf-yang-types {
    prefix yang;
    reference
      "RFC 6991: Common YANG Data Types";
  }

```

```

### A.3. Example Queries

The following sections are presented in reverse query-parameters processing order. Starting with the simplest (limit) and ending with the most complex (where).

All the vector tests are presented in a protocol-independent manner. JSON is used only for its conciseness.

## A.3.1. The "limit" Parameter

Noting that "limit" must be a positive number, the edge condition values are '1', '2', num-elements-1, num-elements, and num-elements+1.

If '0' were a valid limit value, it would always return an empty result set. Any value greater than or equal to num-elements results the entire result set, same as when "limit" is unspecified.

These vector tests assume the target "/example-social:members/member=alice/favorites/uint8-numbers", which has six values, thus the edge condition "limit" values are: '1', '2', '5', '6', and '7'.

## A.3.1.1. limit=1

REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: -  
Offset: -  
Limit: 1

RESPONSE

```
{
  "example-social:uint8-numbers": [17],
  "@example-social:uint8-numbers": [
    {
      "ietf-list-pagination:remaining": 5
    }
  ]
}
```

## A.3.1.2. limit=2

REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: -  
Offset: -  
Limit: 2

RESPONSE

```
{
  "example-social:uint8-numbers": [17, 13],
  "@example-social:uint8-numbers": [
    {
      "ietf-list-pagination:remaining": 4
    }
  ]
}
```

A.3.1.3. limit=5

REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: -  
Offset: -  
Limit: 5

RESPONSE

```
{
  "example-social:uint8-numbers": [17, 13, 11, 7, 5],
  "@example-social:uint8-numbers": [
    {
      "ietf-list-pagination:remaining": 1
    }
  ]
}
```

A.3.1.4. limit=6

REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: -  
Offset: -  
Limit: 6

RESPONSE

```
{  
  "example-social:uint8-numbers": [17, 13, 11, 7, 5, 3]  
}
```

A.3.1.5. limit=7

REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: -  
Offset: -  
Limit: 7

RESPONSE

```
{  
  "example-social:uint8-numbers": [17, 13, 11, 7, 5, 3]  
}
```

A.3.2. The "offset" Parameter

Noting that "offset" must be an unsigned number less than or equal to the num-elements, the edge condition values are '0', '1', '2', num-elements-1, num-elements, and num-elements+1.

These vector tests again assume the target "/example-social:members/member=alice/favorites/uint8-numbers", which has six values, thus the edge condition "limit" values are: '0', '1', '2', '5', '6', and '7'.

A.3.2.1. offset=0

REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: -  
Offset: 0  
Limit: -

RESPONSE

```
{  
  "example-social:uint8-numbers": [17, 13, 11, 7, 5, 3]  
}
```

A.3.2.2. offset=1

REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: -  
Offset: 1  
Limit: -

RESPONSE

```
{  
  "example-social:uint8-numbers": [13, 11, 7, 5, 3]  
}
```

A.3.2.3. offset=2

REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: -  
Offset: 2  
Limit: -

RESPONSE

```
{
  "example-social:uint8-numbers": [11, 7, 5, 3]
}
```

#### A.3.2.4. offset=5

##### REQUEST

```
Target: /example-social:members/member=alice/favorites:uint8-numbers
Pagination Parameters:
  Where:      -
  Sort-by:    -
  Direction:  -
  Offset:     5
  Limit:      -
```

##### RESPONSE

```
{
  "example-social:uint8-numbers": [3]
}
```

#### A.3.2.5. offset=6

##### REQUEST

```
Target: /example-social:members/member=alice/favorites:uint8-numbers
Pagination Parameters:
  Where:      -
  Sort-by:    -
  Direction:  -
  Offset:     6
  Limit:      -
```

##### RESPONSE

```
{
  "example-social:uint8-numbers": []
}
```

#### A.3.2.6. offset=7

##### REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: -  
Offset: 7  
Limit: -

RESPONSE

ERROR

#### A.3.3. The "direction" Parameter

Noting that "direction" is an enumeration with two values, the edge condition values are each defined enumeration.

The value "forwards" is sometimes known as the "default" value, as it produces the same result set as when "direction" is unspecified.

These vector tests again assume the target "/example-social:members/member=alice/favorites/uint8-numbers". The number of elements is relevant to the edge condition values.

It is notable that "uint8-numbers" is an "ordered-by" user leaf-list. Traversals are over the user-specified order, not the numerically-sorted order, which is what the "sort-by" parameter addresses. If this were an "ordered-by system" leaf-list, then the traversals would be over the system-specified order, again not a numerically-sorted order.

##### A.3.3.1. direction=forwards

REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: -  
Direction: forwards  
Offset: -  
Limit: -

RESPONSE

```
{
  "example-social:uint8-numbers": [17, 13, 11, 7, 5, 3]
}
```

#### A.3.3.2. direction=backwards

##### REQUEST

```
Target: /example-social:members/member=alice/favorites:uint8-numbers
Pagination Parameters:
  Where:      -
  Sort-by:    -
  Direction:  backwards
  Offset:     -
  Limit:      -
```

##### RESPONSE

```
{
  "example-social:uint8-numbers": [3, 5, 7, 11, 13, 17]
}
```

#### A.3.4. The "sort-by" Parameter

Noting that the "sort-by" parameter is a node identifier, there is not so much "edge conditions" as there are "interesting conditions". This section provides examples for some interesting conditions.

##### A.3.4.1. the target node's type

The section provides three examples, one for a "leaf-list" and two for a "list", with one using a direct descendent and the other using an indirect descendent.

###### A.3.4.1.1. type is a "leaf-list"

This example illustrates when the target node's type is a "leaf-list". Note that a single period (i.e., '.') is used to represent the nodes to be sorted.

This test again uses the target "/example-social:members/member=alice/favorites:uint8-numbers", which is a leaf-list.

##### REQUEST

Target: /example-social:members/member=alice/favorites/uint8-numbers

Pagination Parameters:

Where: -  
Sort-by: .  
Direction: -  
Offset: -  
Limit: -

RESPONSE

```
{  
  "example-social:uint8-numbers": [3, 5, 7, 11, 13, 17]  
}
```

A.3.4.1.2. type is a "list" and sort-by node is a direct descendent

This example illustrates when the target node's type is a "list" and a direct descendent is the "sort-by" node.

This vector test uses the target "/example-social:members/member", which is a "list", and the sort-by descendent node "member-id", which is the "key" for the list.

REQUEST

Target: /example-social:members/member

Pagination Parameters:

Where: -  
Sort-by: member-id  
Direction: -  
Offset: -  
Limit: -

RESPONSE

| To make the example more understandable, an ellipse (i.e.,  
| "...") is used to represent a missing subtree of data.

```
{
  "example-social:member": [
    {
      "member-id": "alice",
      ...
    },
    {
      "member-id": "bob",
      ...
    },
    {
      "member-id": "eric",
      ...
    },
    {
      "member-id": "joe",
      ...
    },
    {
      "member-id": "lin",
      ...
    }
  ]
}
```

#### A.3.4.1.3. type is a "list" and sort-by node is an indirect descendent

This example illustrates when the target node's type is a "list" and an indirect descendent is the "sort-by" node.

This vector test uses the target `/example-social:members/member`, which is a "list", and the sort-by descendent node `stats/joined`, which is a "config false" descendent leaf. Due to "joined" being a "config false" node, this request would have to target the "member" node in the <operational> datastore.

#### REQUEST

Target: `/example-social:members/member`

Pagination Parameters:

Where: -  
Sort-by: `stats/joined`  
Direction: -  
Offset: -  
Limit: -

#### RESPONSE

| To make the example more understandable, an ellipse (i.e.,  
| "...") is used to represent a missing subtree of data.

```
{
  "example-social:member": [
    {
      "member-id": "alice",
      ...
    },
    {
      "member-id": "lin",
      ...
    },
    {
      "member-id": "bob",
      ...
    },
    {
      "member-id": "eric",
      ...
    },
    {
      "member-id": "joe",
      ...
    }
  ]
}
```

#### A.3.4.2. handling missing entries

The section provides one example for when the "sort-by" node is not present in the data set.

FIXME: need to finish this section...

#### A.3.5. The "where" Parameter

The "where" is an XPath 1.0 expression, there are numerous edge conditions to consider, e.g., the types of the nodes that are targeted by the expression.

##### A.3.5.1. match of leaf-list's values

FIXME

## A.3.5.2. match on descendent string containing a substring

This example selects members that have an email address containing "@example.com".

## REQUEST

Target: /example-social:members/member

## Pagination Parameters:

Where: //.[contains (@email-address,'@example.com')]  
Sort-by: -  
Direction: -  
Offset: -  
Limit: -

## RESPONSE

| To make the example more understandable, an elipse (i.e.,  
| "...") is used to represent a missing subtree of data.

```
{
  "example-social:member": [
    {
      "member-id": "bob",
      ...
    },
    {
      "member-id": "eric",
      ...
    },
    {
      "member-id": "alice",
      ...
    },
    {
      "member-id": "joe",
      ...
    },
    {
      "member-id": "lin",
      ...
    }
  ]
}
```

## A.3.5.3. match on decendent timestamp starting with a substring

This example selects members that have a posting whose timestamp begins with the string "2020".

## REQUEST

Target: /example-social:members/member

Pagination Parameters:

Where: //posts//post[starts-with(@timestamp,'2020')]  
Sort-by: -  
Direction: -  
Offset: -  
Limit: -

## RESPONSE

| To make the example more understandable, an elipse (i.e.,  
| "...") is used to represent a missing subtree of data.

```
{
  "example-social:member": [
    {
      "member-id": "bob",
      ...
    },
    {
      "member-id": "eric",
      ...
    },
    {
      "member-id": "alice",
      ...
    },
    {
      "member-id": "joe",
      ...
    }
  ]
}
```

## A.3.6. The "sublist-limit" Parameter

The "sublist-limit" parameter may be used on any target node.

## A.3.6.1. target is a list entry

This example uses the target node `/example-social:members/member=alice` in the `<intended>` datastore.

| The target node is a specific list entry/element node, not the  
| YANG "list" node.

This example sets the `sublist-limit` value `'1'`, which returns just the first entry for all descendent lists and leaf-lists.

Note that, in the response, the `"remaining"` metadata value is set on the first element of each descendent list and leaf-list having more than one value.

## REQUEST

```
Datastore: <intended>
Target: /example-social:members/member=alice
Sublist-limit: 1
Pagination Parameters:
  Where:      -
  Sort-by:    -
  Direction:  -
  Offset:     -
  Limit:      -
```

## RESPONSE

```
{
  "example-social:member": [
    {
      "member-id": "alice",
      "email-address": "alice@example.com",
      "password": "$0$1543",
      "avatar": "BASE64VALUE=",
      "tagline": "Every day is a new day",
      "privacy-settings": {
        "hide-network": "false",
        "post-visibility": "public"
      },
      "following": ["bob"],
      "@following": [
        {
          "ietf-list-pagination:remaining": "2"
        }
      ],
      "posts": {
        "post": [
          {
            "@": {
              "ietf-list-pagination:remaining": "1"
            },
            "timestamp": "2020-07-08T13:12:45Z",
            "title": "My first post",
            "body": "Hiya all!"
          }
        ]
      },
      "favorites": {
        "uint8-numbers": [17],
        "int8-numbers": [-5],
        "@uint8-numbers": [
          {
            "ietf-list-pagination:remaining": "5"
          }
        ],
        "@int8-numbers": [
          {
            "ietf-list-pagination:remaining": "5"
          }
        ]
      }
    }
  ]
}
```

## A.3.6.2. target is a datastore

This example uses the target node <intended>.

This example sets the sublist-limit value '1', which returns just the first entry for all descendent lists and leaf-lists.

Note that, in the response, the "remaining" metadata value is set on the first element of each descendent list and leaf-list having more than one value.

## REQUEST

```
Datastore: <intended>
Target: /
Sublist-limit: 1
Pagination Parameters:
  Where:      -
  Sort-by:    -
  Direction:  -
  Offset:     -
  Limit:      -
```

## RESPONSE

```
{
  "example-social:members": {
    "member": [
      {
        "@": {
          "ietf-list-pagination:remaining": "4"
        },
        "member-id": "bob",
        "email-address": "bob@example.com",
        "password": "$0$1543",
        "avatar": "BASE64VALUE=",
        "tagline": "Here and now, like never before.",
        "posts": {
          "post": [
            {
              "@": {
                "ietf-list-pagination:remaining": "2"
              },
              "timestamp": "2020-08-14T03:32:25Z",
              "body": "Just got in."
            }
          ]
        },
        "favorites": {
          "decimal64-numbers": ["3.14159"],
          "@decimal64-numbers": [
            {
              "ietf-list-pagination:remaining": "1"
            }
          ]
        }
      ]
    ]
  }
}
```

### A.3.7. Combinations of Parameters

#### A.3.7.1. All six parameters at once

REQUEST

```
Datastore: <operational>
Target: /example-social:members/member
Sublist-limit: 1
Pagination Parameters:
  Where:      //stats//joined[starts-with(@timestamp,'2020')]
  Sort-by:    member-id
  Direction:  backwards
  Offset:     2
  Limit:      2
```

## RESPONSE

```
{
  "example-social:member": [
    {
      "@": {
        "ietf-list-pagination:remaining": "1"
      },
      "member-id": "eric",
      "email-address": "eric@example.com",
      "password": "$0$1543",
      "avatar": "BASE64VALUE=",
      "tagline": "Go to bed with dreams; wake up with a purpose.",
      "following": ["alice"],
      "posts": {
        "post": [
          {
            "timestamp": "2020-09-17T18:02:04Z",
            "title": "Son, brother, husband, father",
            "body": "What's your story?"
          }
        ]
      },
      "favorites": {
        "bits": ["two"],
        "@bits": [
