[IETF#116 - BMWG meeting, Yokohama / **Remote**]
[March 28, 2023]

Reminder (1/2): Why We Need New Methodology

- ([IETF-112](#)) Problems and Requirements of Benchmarking Methodology for Integrated Space and Terrestrial Networks (ISTN)
 - **Trend:** We are on the high-way towards ISTN, networking the globe through low-earth-orbit (LEO) mega-constellations and terrestrial networks.
 - **New Network:** ISTN are featured by global-level high dynamicity and unexplored uncertainty, requiring NEW network designs, which should be comprehensively and systematically benchmarked **in lab** before launch.
 - **Requirements:** (a) Constellation and Network Realism, (b) Flexibility at Mega-constellation Scale, (c) Realistic Data and Test Cases, (d) Low-cost and Easy-to-use.
 - Existing benchmarking methodologies are insufficient.

Reminder (2/2): Considerations for New Methodology

- ([IETF-115](#)) Considerations for Benchmarking Network Performance in Integrated Space and Terrestrial Networks (ISTN)
 - What is the expected **qualified** and **in-lab** benchmarking methodology for ISTN?
- A Data-Driven, Emulation-based Benchmarking Approach:

① community-driven data collection

- ◆ Public ISTN information, such as constellation topology, user measurements ...

② real-data-driven ITE setup

- ◆ Build an ITE via VM- or container-based emulation, with mimicked LEO behaviors (dynamics)

③ specify DUT/SUT and run test cases

- ◆ Deploy DUT/SUT in ITE
- ◆ Run specific test cases
- ◆ Collect and report results

Update towards Concrete Benchmarking Methodology

- Parameter Setup of the Benchmarking Environment for ISTN
 - Concretizing Stage-①: community-driven data collection.
 - Driven by (a) Regulatory Data, (b) Live Data and (c) Crowd-sourcing Data.
 - Showcases: Network Performance under Different Environment Setups.
- Future Work
 - Concretizing all the following stages, by cooperating with academia, industrial and IETF community.

① community-driven data collection

- ◆ Public ISTN information, such as constellation topology, user measurements ...

② real-data-driven ITE setup

- ◆ Build an ITE via VM- or container-based emulation, with mimicked LEO behaviors (dynamics)

③ specify DUT/SUT and run test cases

- ◆ Deploy DUT/SUT in ITE
- ◆ Run specific test cases
- ◆ Collect and report results

Parameter Setup of the Benchmarking Environment

Terminology
In Last Draft

Setup
To Present Today

5.2.1 Constellation Orbital Parameters (1/3)

- Regulatory-Data-Driven Orbital Parameters: SHOULD be tested
 - Orbital parameters of the constellations are reviewed and made public by regulatory agencies (eg. FCC, ITU, etc.).
 - Should be followed by the operators in principle, thus representing the ideal situation of the constellations.
- Live-Data-Driven Orbital Parameters: is RECOMMENDED
 - Based on live constellation GP data (*general perturbations* orbital data, also known for TLE) from celestrak.org.
 - Produced by fitting observations (radar and optical) from US Space Surveillance Network (SSN) and provided continuously, representing the live situation of the constellations.

5.2.1 Constellation Orbital Parameters (2/3)

- Regulatory-Data-Driven Orbital Parameters: SHOULD be tested
 - Both Polar-orbit and Inclined-orbit constellations SHOULD be tested, unless the DUT/SUT is designed with orbital preferences, and MUST be stated in the report.
 - A table of the SoA constellations' parameters is provided:

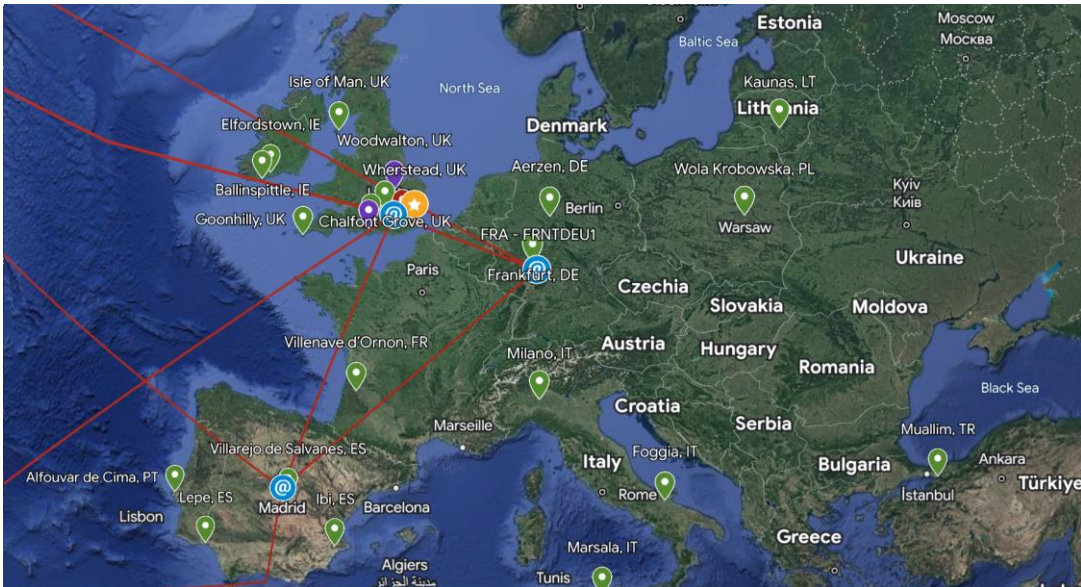

Name and Shell	Altitude (km)	Inclination (degree)	# of orbits	# of satellites per orbit	Polar / Inclined
Starlink	550	53	72	22	Inclined
Starlink-2	540	53.2	72	22	Inclined
Starlink-3	570	70	36	20	Inclined
Starlink-4	560	97.6	6	58	Polar
Starlink-5	560	97.6	4	43	Polar
Kuiper	630	51.9	34	34	Inclined
Kuiper-2	610	42	36	36	Inclined
Kuiper-3	590	33	28	28	Inclined
Telesat	1015	98.98	27	13	Polar
Telesat-2	1325	50.88	40	33	Inclined
OneWeb	1200	87.9	12	49	Polar
OneWeb-2	1200	55	8	16	Inclined

5.2.1 Constellation Orbital Parameters (3/3)

- Live-Data-Driven Orbital Parameters: is RECOMMENDED
 - Among GP and SupGP, SupGP data is RECOMMENDED.
 - SupGP (Supplemental GP) is derived directly from owner/operator-supplied orbital data, providing reduced latency and improved accuracy.
 - The Max Age of GP or SupGP SHALL be less than 1 day and MUST be less than 5 days.
 - Extra Orbital Determination Process
 - Comparing to Regulatory-Data, Live-Data is more accurate (in terms of per-satellite position), and also easy-to-get. However, Live-Data requires extra orbital determination process (implying inter-satellite relationship) to support network experiments.
 - Once the orbital determination process is standardized, Live-Data-Driven Orbital Parameters shall SHOULD be used to benchmark.

5.2.2 Ground Station (GS) Distribution

- Crowd-Sourcing-Data-Driven GS distribution is RECOMMENDED.
 - Which is often refined by fans community based on Regulatory-Data.
- Other OPTIONAL Open Data:
 - *Amazon AWS, Azure Orbital*, and other open Ground Station Distribution.

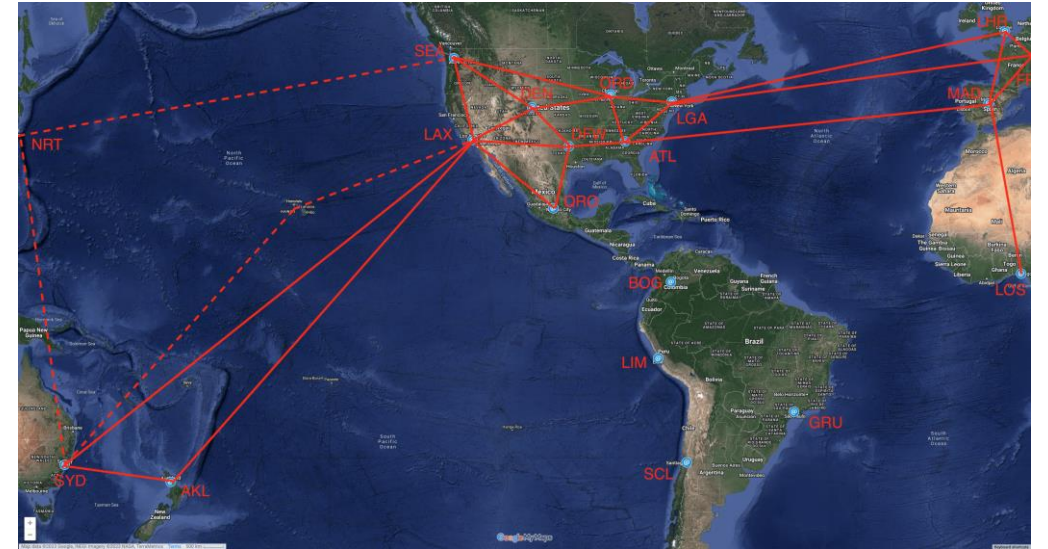

Starlink GS in EU, featuring details from community

Amazon AWS Ground Station as a Service 9

5.2.3 Connectivity Pattern

- Crowd-Sourcing-Data-Driven:
 - e.g. Inter-Ground Station Connectivity of Starlink Ground Stations (figure) is explored with traceroute from the fans community.
- Strategy-based Parameter Setup:
 - Inter-Satellite Connectivity
 - [+Grid] is RECOMMENDED, where the satellites are connected with 4 neighbors and form a massive grid across the constellation.
 - [Inner-orbit Only], [motif] are other OPTIONAL strategies.
 - Ground-Satellite Connectivity
 - [Nearest Ground Station with Antenna Quota] is RECOMMENDED.
 - Where each ground station is with 8 antenna quota is RECOMMENDED.

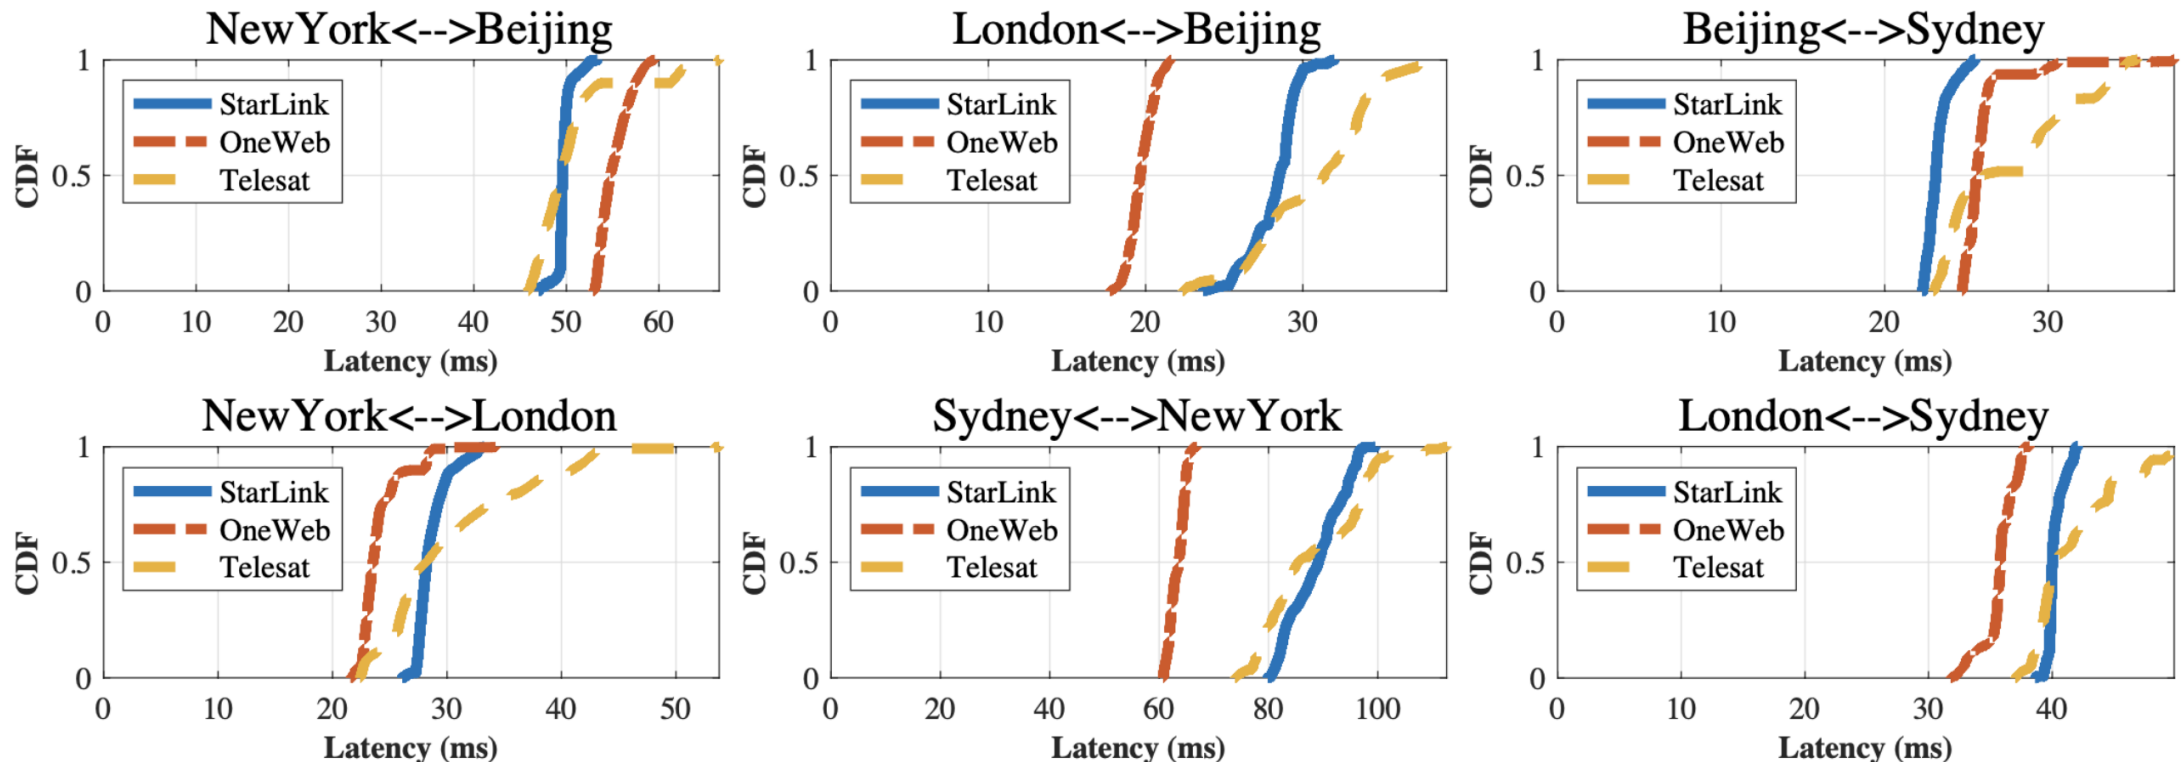

5.2.4 Network Link

- Strategy-based Network Link Setup is RECOMMENDED
 - The propagation latency of ground-satellite link (RF) and inter-satellite link (free-space optical) could be derived from distance and light-speed.
 - The capacity of ground-satellite link could be set as 1 ~ 5 Gbps. Specific value MAY be derived from frequency band info from regulatory data.
 - The capacity of inter-satellite link could be set as 5~20 Gbps.
- Related Crowd-Sourcing Data
 - Measurement data (figure) on path latency and bandwidth from real satellite users are relative, but we didn't find a good way to use.
 - They may help on determining the coefficient when calculating latency from distance.

Show Cases

- Latencies under different constellations with Regulatory-Data
 - Statistics of latency (OSPF) between ground stations around the world

Future Work

- With Self-owned Devices:
 - Collecting more data with big devices (satellite dishes and high-end servers).
- With Academia:
 - *StarryNet*, our latest work on ISTN emulator, will be presented on NSDI'23.
- With Industrial:
 - Working closely with our cooperation partner (satellite communication operator) on ISTN design and benchmarking.
- With IETF Community, see you in-person at IETF-117 and more:
 - Request for comments on what we present here today, and in future.
 - Toward benchmarking methodology for routing / transport / security in ISTN
 - Definition and measurement methodology of specific metrics
 - Distribution of end-users, Duration of benchmarking
 - Dedicated Setup of DUT/SUT in ISTN

THANKS
