00

Oct 2022

Feb 2023

- Split the original draft into 2 drafts,
  - draft-zhou-rtgwg-sinc depicts the main spec
  - draft-zhou-rtgwg-sinc-deployment-considerations covers the deployment considerations
- New co-author: Jinze Yang

# Updates since IETF 115

12.2. Informative References . . . . .	11
Appendix A. Computing Capability Operation abstraction . . . . .	14
Authors' Addresses . . . . .	15

- Moved the SFC part to a new “deployment consideration” draft

- Provided a SINC framework overview

- Discussed about the data operation mode
  - Individual computing mode
  - Batch computing mode

- Updated the SINC header format

- Added control plane requirements

- Overall text refinement

# SINC Use Cases (recap)

## NetReduce

- ❖ Comparing with the host oriented solutions, in-network aggregation could potentially reduce nearly half the aggregation data
- ❖ NetReduce is >1.5x faster, and has better scalability than ring all-reduce.

## NetLock

- ❖ The lock manager can be abstracted as Compare And Swap (CAS) or Fetch Add (FA) operations.
- ❖ The test results in NetLock[1] show that the lock manager running on a switch is able to answer 100 million requests per second, nearly 10 times more than what a lock server can do.

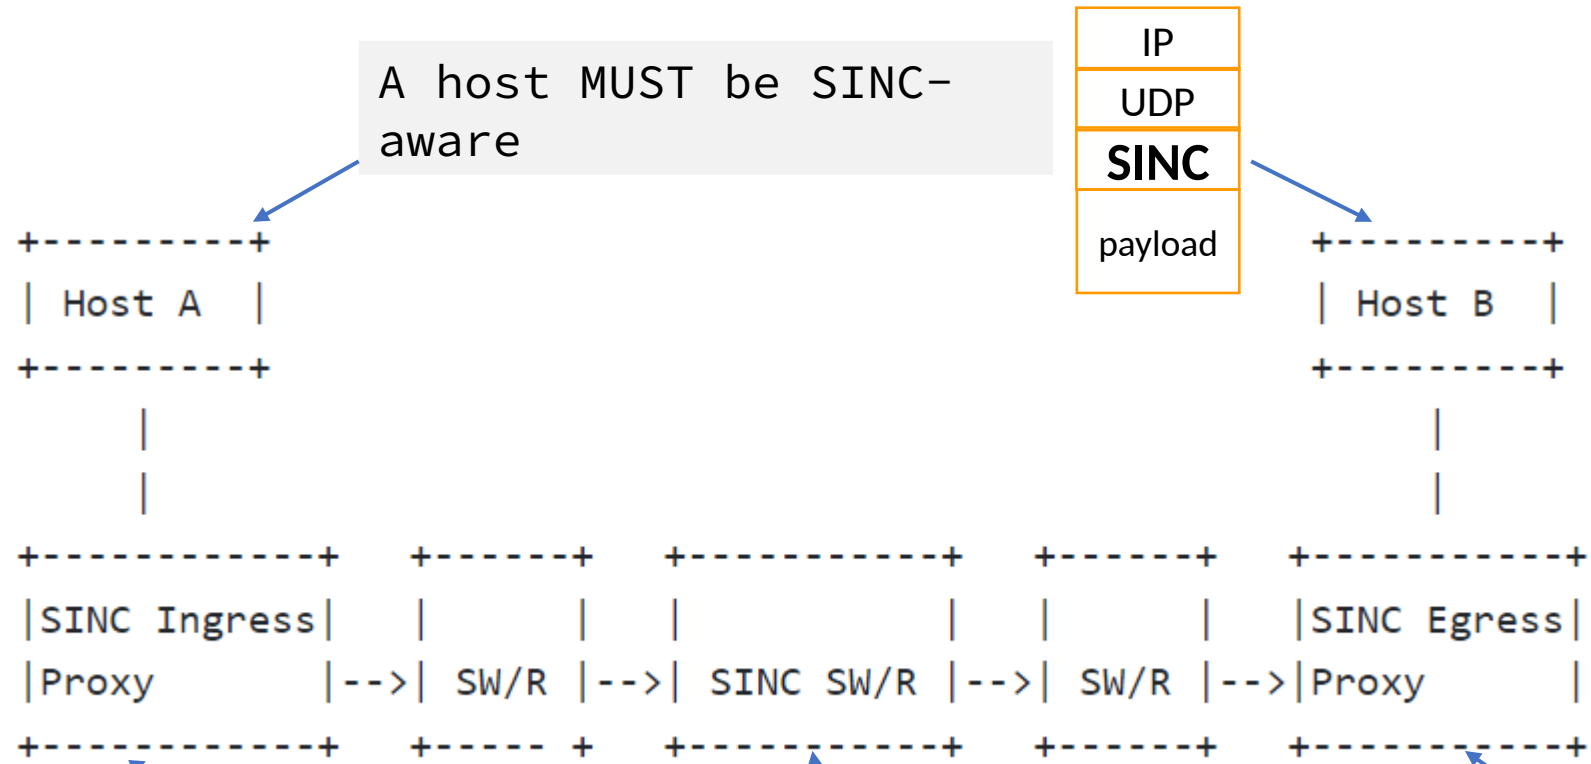

## NetSequencer

- ❖ Switches could realize the sequencer[2] by using a "Fetch-and-Add" operation.
- ❖ Compared with Gbps-level throughput of servers, network devices have Tbps-level throughput and line-rate processing capabilities

An explicit and general mechanism is required to tell the switch how to process the packet

# SINC Framework

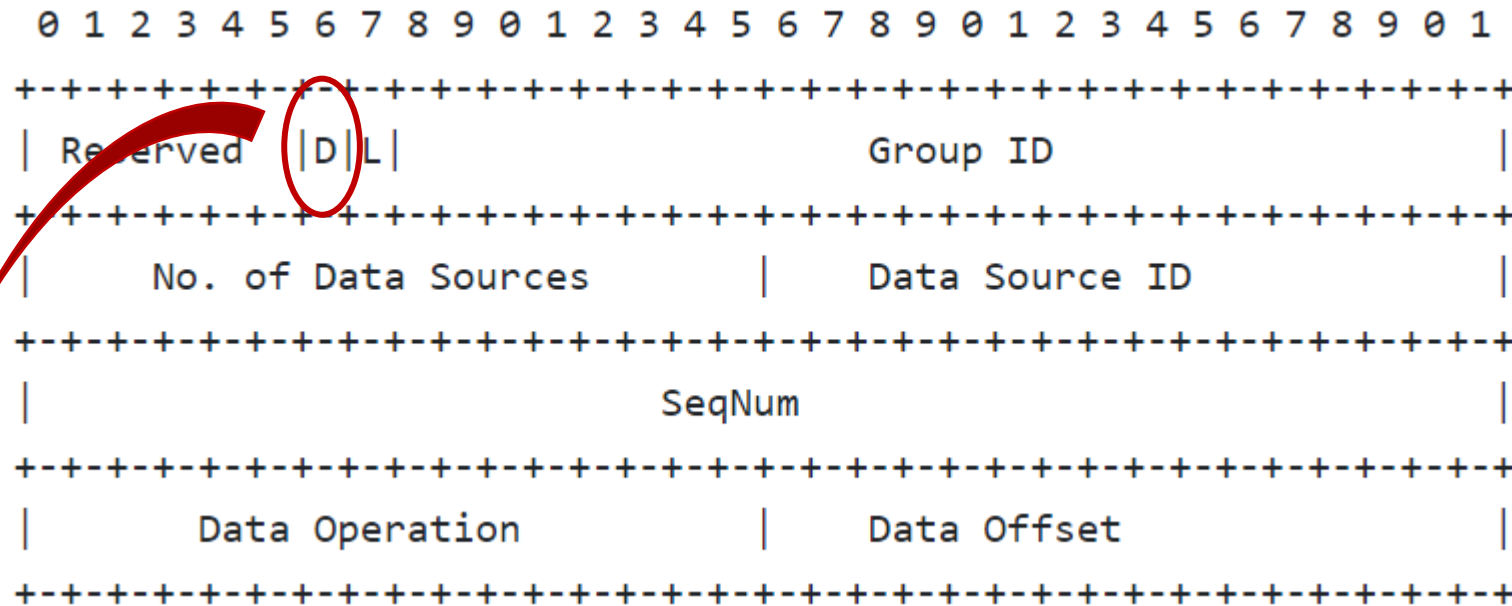

SINC Ingress Proxy encapsulates the packet

SINC-capable switches/routers executes all or part of the data computation during the transmission

SINC Egress Proxy removes the encapsulation

# SINC Header

- ❖ **Loopback flag (L):** Zero (0) -> be sent to the destination; One (1) -> be sent back to the source node.
- ❖ **Done flag (D):** Zero (0) -> the request operation is not yet performed; One (1) -> the operation has been done.
- ❖ **Group ID:** Identifies different groups
- ❖ **Number of Data Sources:** Total number of data source nodes that are part of the group.
- ❖ **Data Source ID:** Unique identifier of the data source node of the packet.
- ❖ **Sequence Number (SeqNum):** The SeqNum is used to identify different requests within one group.
- ❖ **Data Operation:** The operation to be performed, like ADD, SUM, MAX, MIN
- ❖ **Data Offset:** The in-packet offset from the SINC context header to the data required by the operation.

# Control Plane Requirements

- ❖ The SINC control plane should **be aware of the switch resources**. This may be achieved by regularly querying the devices.
- ❖ The SINC control plane should be able to **select the switches/routers based on certain constraints**. For instance selecting switches/routers that are able to perform a specific more complex operations, or being able to distribute the load on various alternative switches/routers without increasing the transmission delay.
- ❖ The SINC control plane should be able to **provide the necessary configuration** so that packets flow to the right place and encapsulation/decapsulation operations are performed correctly.
- ❖ The SINC control plane should provide **monitoring and failover mechanism** in order to handle errors and failures.

# Next Steps

- Encourage discussion on the mailing lists of the RTG WG
- Update the draft based on comments and remarks
- Welcome to contributions and co-authors

# THANKS!

- General deployment considerations

- Example of SINC over SFC

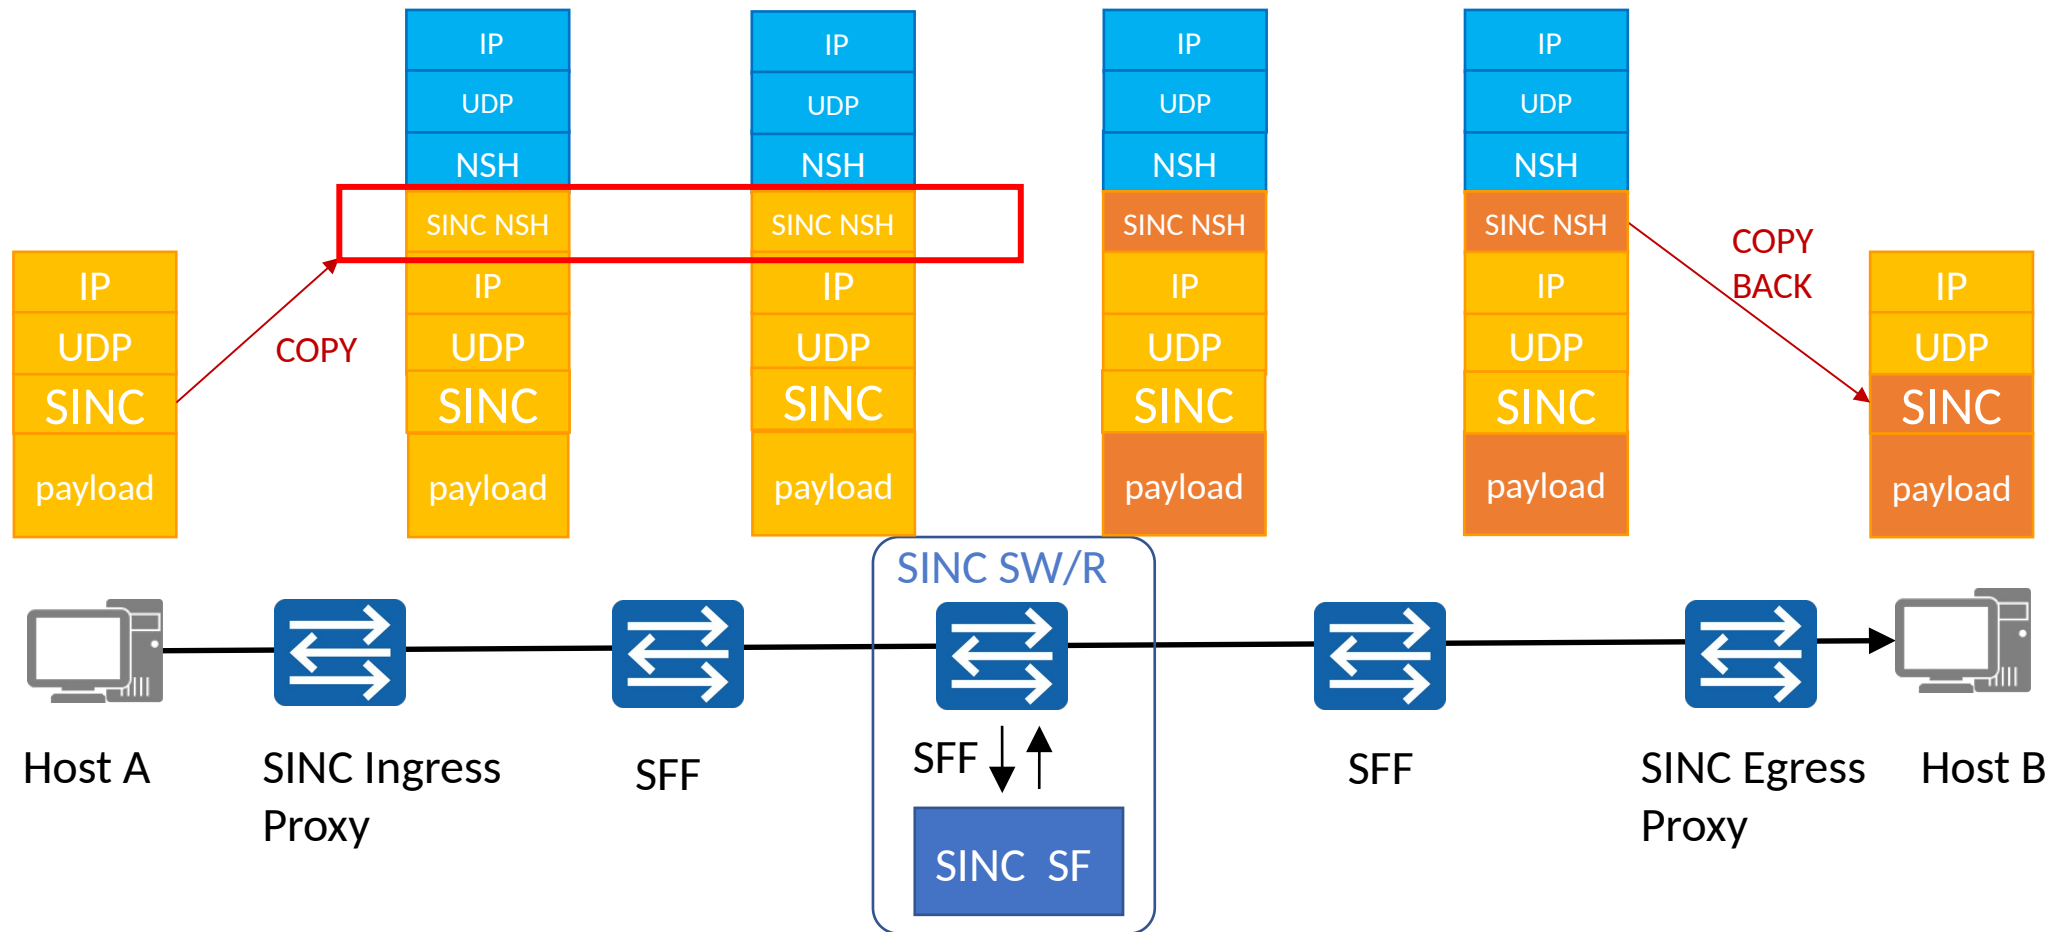

- Example of SINC over MPLS

# Deployment Considerations

- ❖ The SINC capable SW/Rs should periodically advertise their networking and computing capacities and capabilities
- ❖ The control plane is responsible to create a proper route where the data in the packet will undertake the desired computation before arriving at the destination host.
- ❖ The encapsulation could be located at layer 2, 3 or 4 dependent of the network context and application environments
- ❖ The SINC header is usually copied right after the new encapsulation header, which makes it easier to access

# Example: SINC over SFC

# SINC NSH Encapsulation

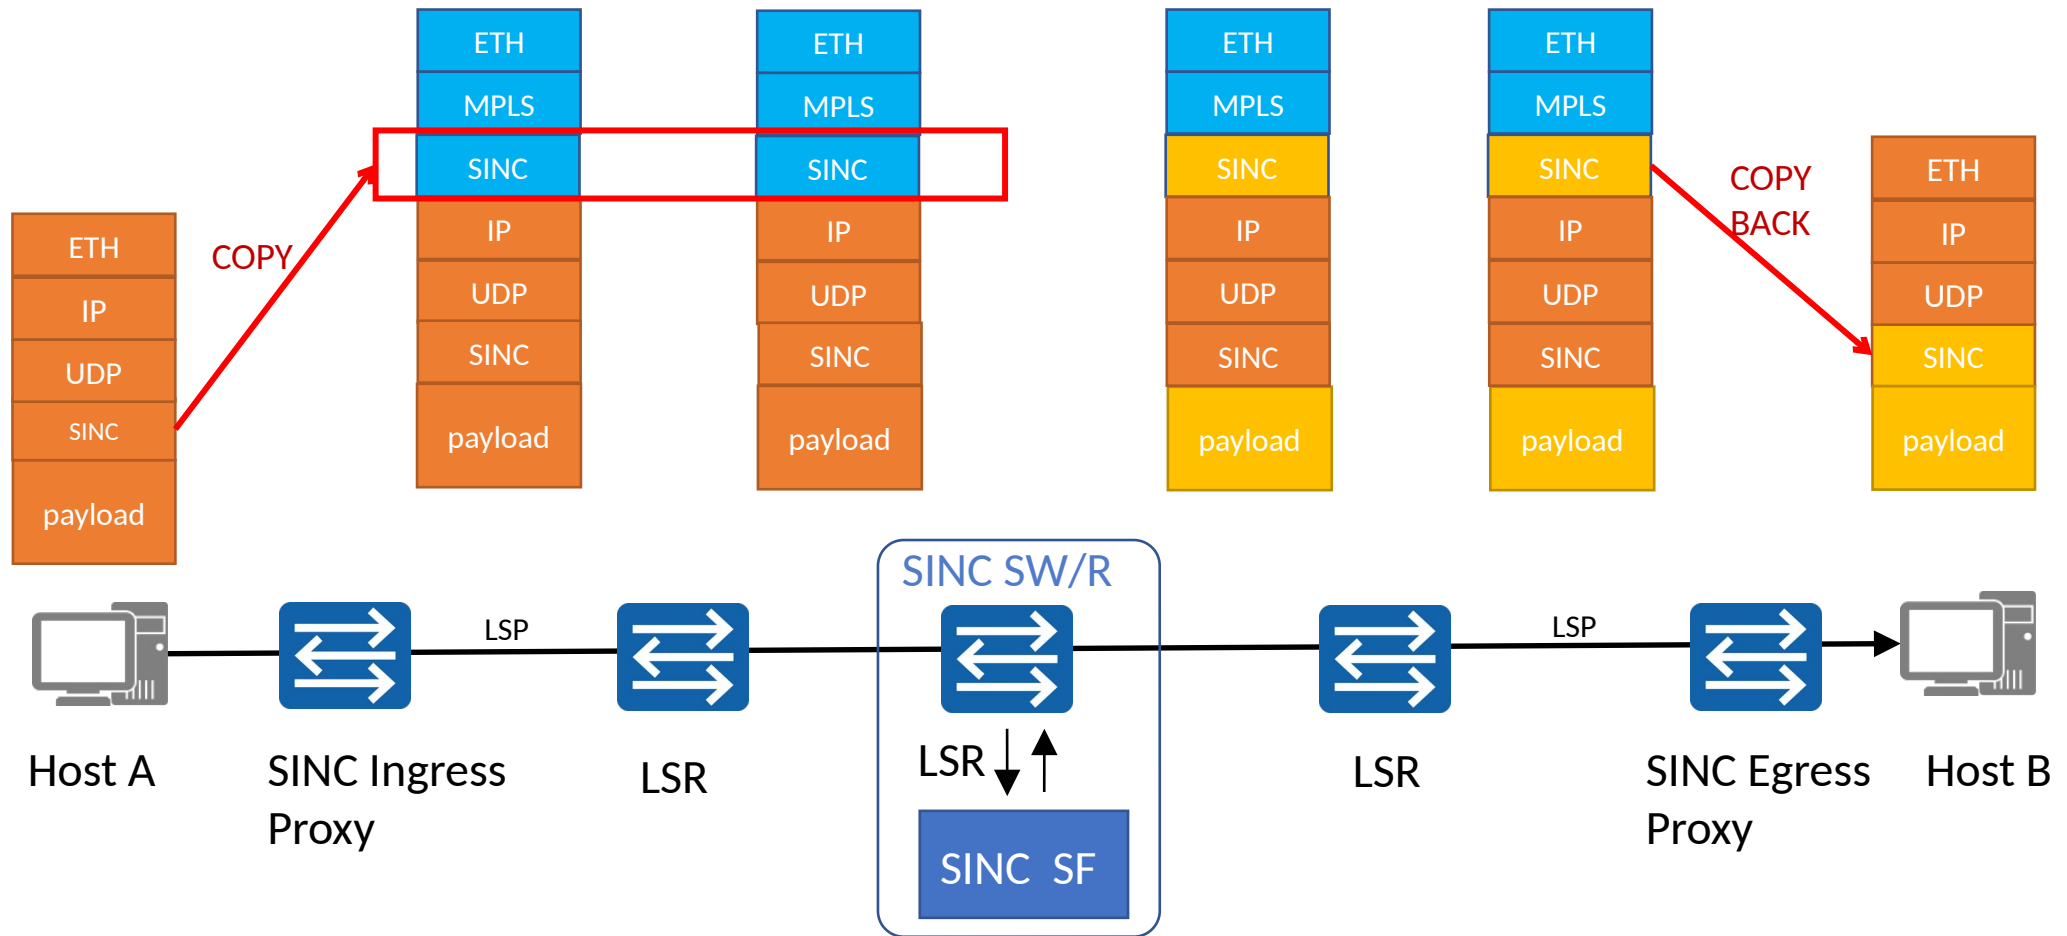

## ❖ NSH Base Header:

- ❖ Use the NSH Meta Data (MD) fixed-length context headers to carry the data operation information
- ❖ MD type = 0x1 (suggested) was used in the draft because the size of the original design of the SINC header is 16 bytes.

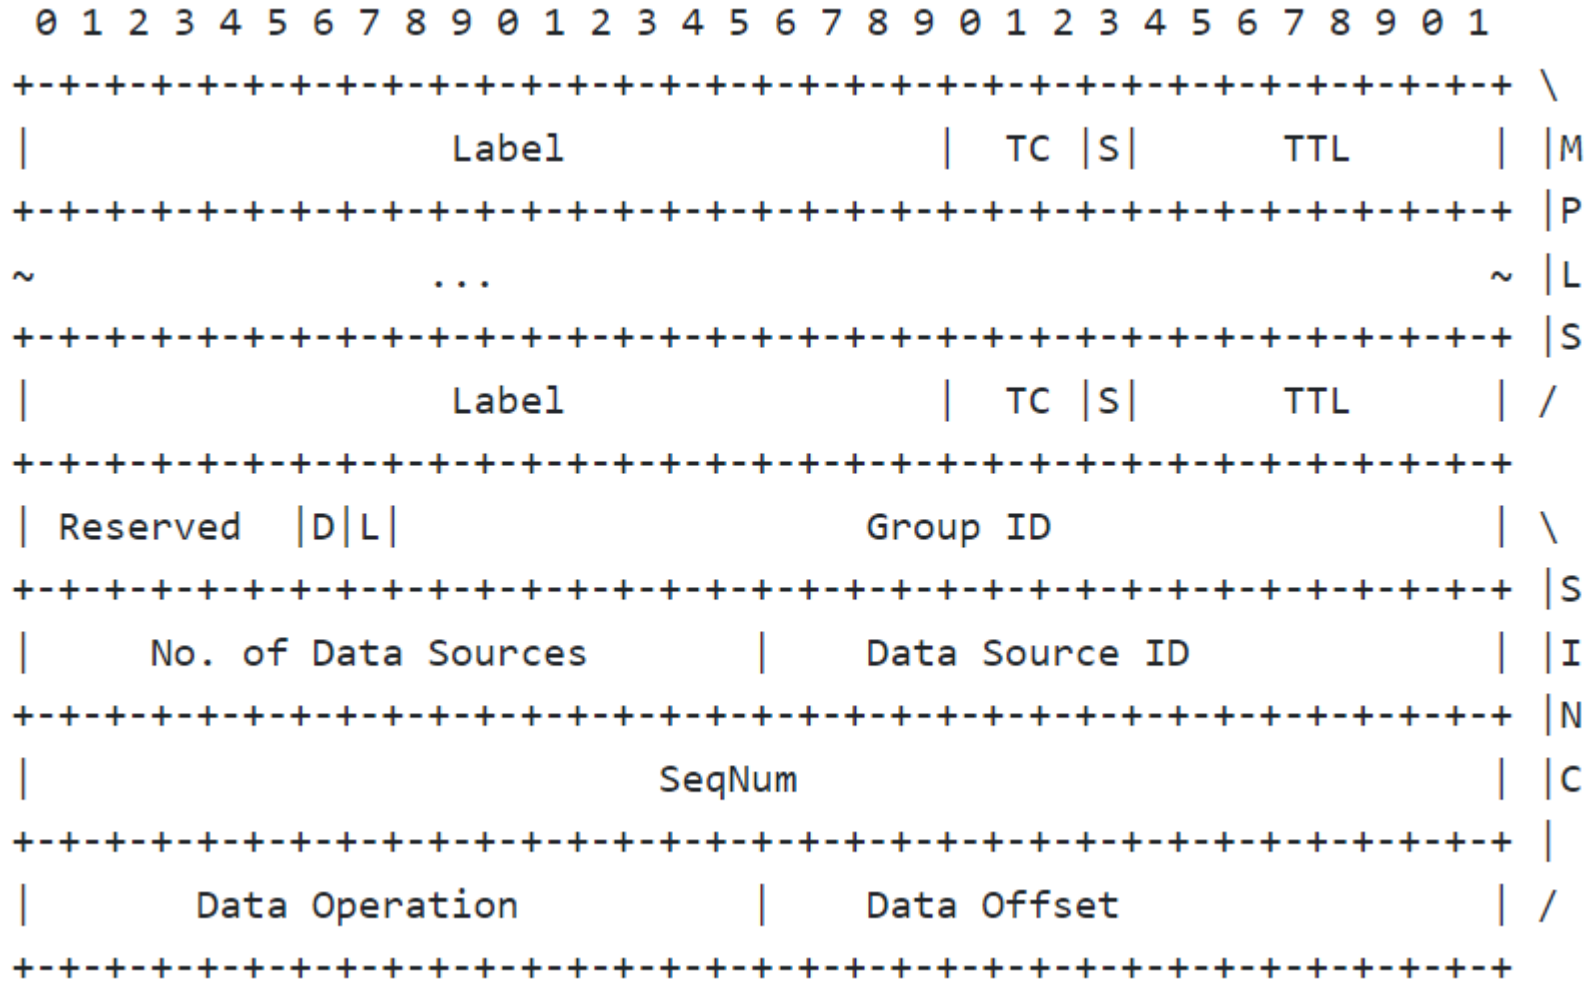

## ❖ NSH Service Path Header: as defined in RFC 8300.

## ❖ SINC Context Header: as defined SINC Header.

# Example: SINC over MPLS

# SINC MPLS Encapsulation

# Next Steps

- Encourage discussion on the mailing lists of the RTG WG
- Update the draft based on comments and remarks
- Welcome to contributions and co-authors
