

draft-ietf-suit-trust- domains-02

ietf116

March 2023

Summary

- Added explicit check of dependency integrity
- Add self-reference component ID
- Fixed Dependency Resolution sequence key

Dependency integrity check

- The previous version required the manifest processor to identify whether the current component was a manifest or an image and act accordingly
- This requires the manifest to choose between manifest validation or image validation when checking the integrity of a given image.
- Simplifies the logic for the Manifest Processor

Self-reference component ID

- When a system has more than one root manifest, where should it live?
- The manifest-component-id element provides a default location for storing the current manifest
- It is overridden by a manifest that references it.
