Connected Identity

STIR WG IETF 117
Jul 2023 (SF)
Revisiting RFC4916

• The “connected identity” draft, update (?) to RFC4916
  – How to make Identity work in the backwards direction
  – RFC4916 covered mid-dialog and dialog-terminating requests
    • Classic use case is UPDATE in the backwards direction before 200 OK: telling you who you actually reached

• Leveraging STIR to close security vulnerabilities
  – Route hijacking
    • I tried to call my bank, by an attacker somehow interposed
  – “Call stretching” and similar attacks
    • Intermediary networks forging BYE in one direction while the call proceeds in another
  – sipbrandy (RFC8862) needs it

• This does take STIR past the threat model of RFC7375
  – (Charter now reflects that)
The “rsp” PASSporT Type

• A PASSporT type that can only be sent in responses
  – Not necessarily limited to SIP, but, covered here with SIP as the focus
  – “rsp” is signed like “div” – the signing PASSporT has authority for the “dest” field rather than the “orig”

• In the sunny day case, where there is no diversion, pretty simple really
  – When you receive a SIP request with an Identity header, you can send a response (18x, and 200) with an Identity header
    • Ultimately, you may get a couple 18x’s, so the 200 cements the called party identity
  – Good enough for SIPBRANDY ”mky” protection and other cases we care about
    • SIPBRANDY encourages UAC and UAS to act as AS/VS, say
There’s a new version

• WGLC happened
• Thanks to Russ for a review
  – Removed changelog
  – Clarified non-dialog forming responses (3xx, etc.)
  – Filled in some of the back matter (IANA etc)
• I-D name really no longer applies – this will not formally “update” RFC4916, but eh
  – The RFC won’t have the i-d name in it anymore
Next Steps

• Now post-WGLC
• Advance to IESG if everyone is cool with the fixes in my last revision
