

# Email Feedback Reports for DKIM Signers

IETF 118 | DISPATCH

# Providers send spam reports

- Webmail user reads her mail
- Presses the junk button
- Provider tells the mail sender

# How it works now

- Everyone but Yahoo
  - Senders privately register their IP addresses
  - ARF report destination based on the IP address
- Yahoo
  - Senders privately register their domains
  - ARF report destination based on DKIM signature

# How it doesn't work now

- Private registration doesn't scale
- Middlemen are trying to monetize it

# What this draft proposes

- Formalize what Yahoo does
- Publish reporting address in the DNS
- Reports routed based on DKIM signature
  - You get junk reports on what you sign
- No middlemen
- Scales with the DNS

**This does not report DKIM failures. It's user junk reports.**

# The usual questions

- Doesn't seem appropriate for any existing WG
  - It's not DMARC
- AD sponsored? Mini-WG?
