

IPN URI Schema update

<https://datatracker.ietf.org/doc/draft-ietf-dtn-ipn-update/>

Rick Taylor, Ori Industries

IETF-118

Changes since IETF-117 (-06 to -07)

The **only** change is in the “Advice to Designated Experts” regarding the IANA Allocator Identifiers registry.

We have kept:

- Advice about the relative ‘value’ of low integers with a CBOR encoding, as it is a *technical* consideration

We have removed:

- Language concerning governance policy, fair use, and transparency
- All text that requires IANA to operate in a particular manner

Governance and policy text

There is general consensus in the working group that fair access to deep space for all, delivered in a transparent manner, is a “public good”.

However:

- This is a technical specification about a URI encoding.
- The IETF, IANA and the Internet Society already have processes in place that could be adapted.
- The IETF is a networking SDO.

If working group members wish to write up a governance policy document, the chairs, AD, and IESG will assist as best they can: perhaps through WG adoption, or forwarding to another SDO as appropriate.
