

Private Line Emulation Update

draft-ietf-pals-ple

draft-schmutzer-pals-ple-signaling

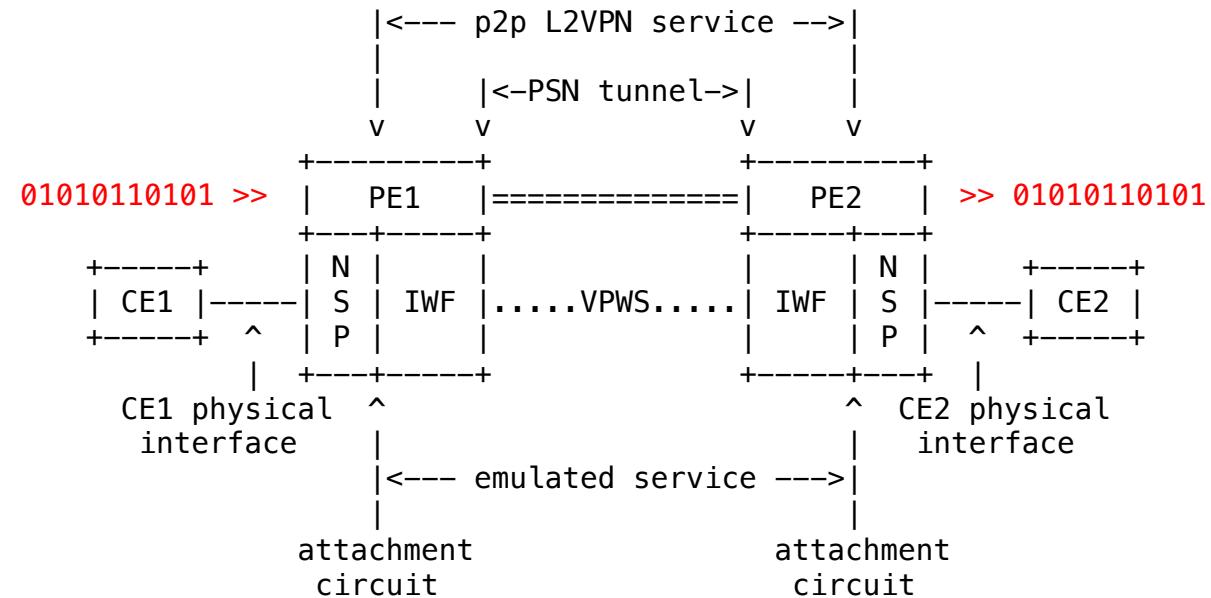

C. Schmutzer (presenter), S. Gringeri, J. Whittaker, N. Leymann, C. Brown

IETF118 Prague, MPLS WG (no dedicated PALS session)

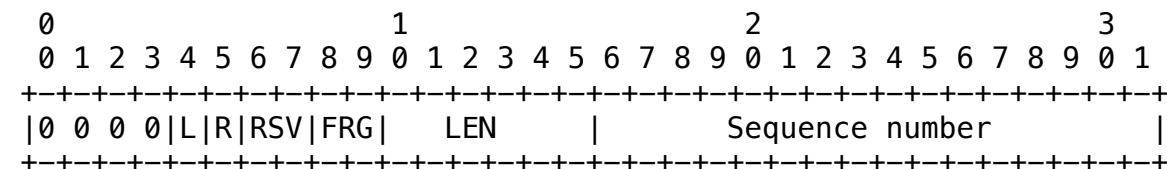

draft-ietf-pals-ple-01

- Emulated services
 - Ethernet
 - SONET/SDH
 - Fibre Channel
 - OTN
- Bit-stream encapsulations
 - Basic payload
 - Byte-aligned payload
- Control word
 - Sequencing
 - Client layer signal failure (L bit)
 - Server layer backward failure (R bit)
- Differential clock recovery

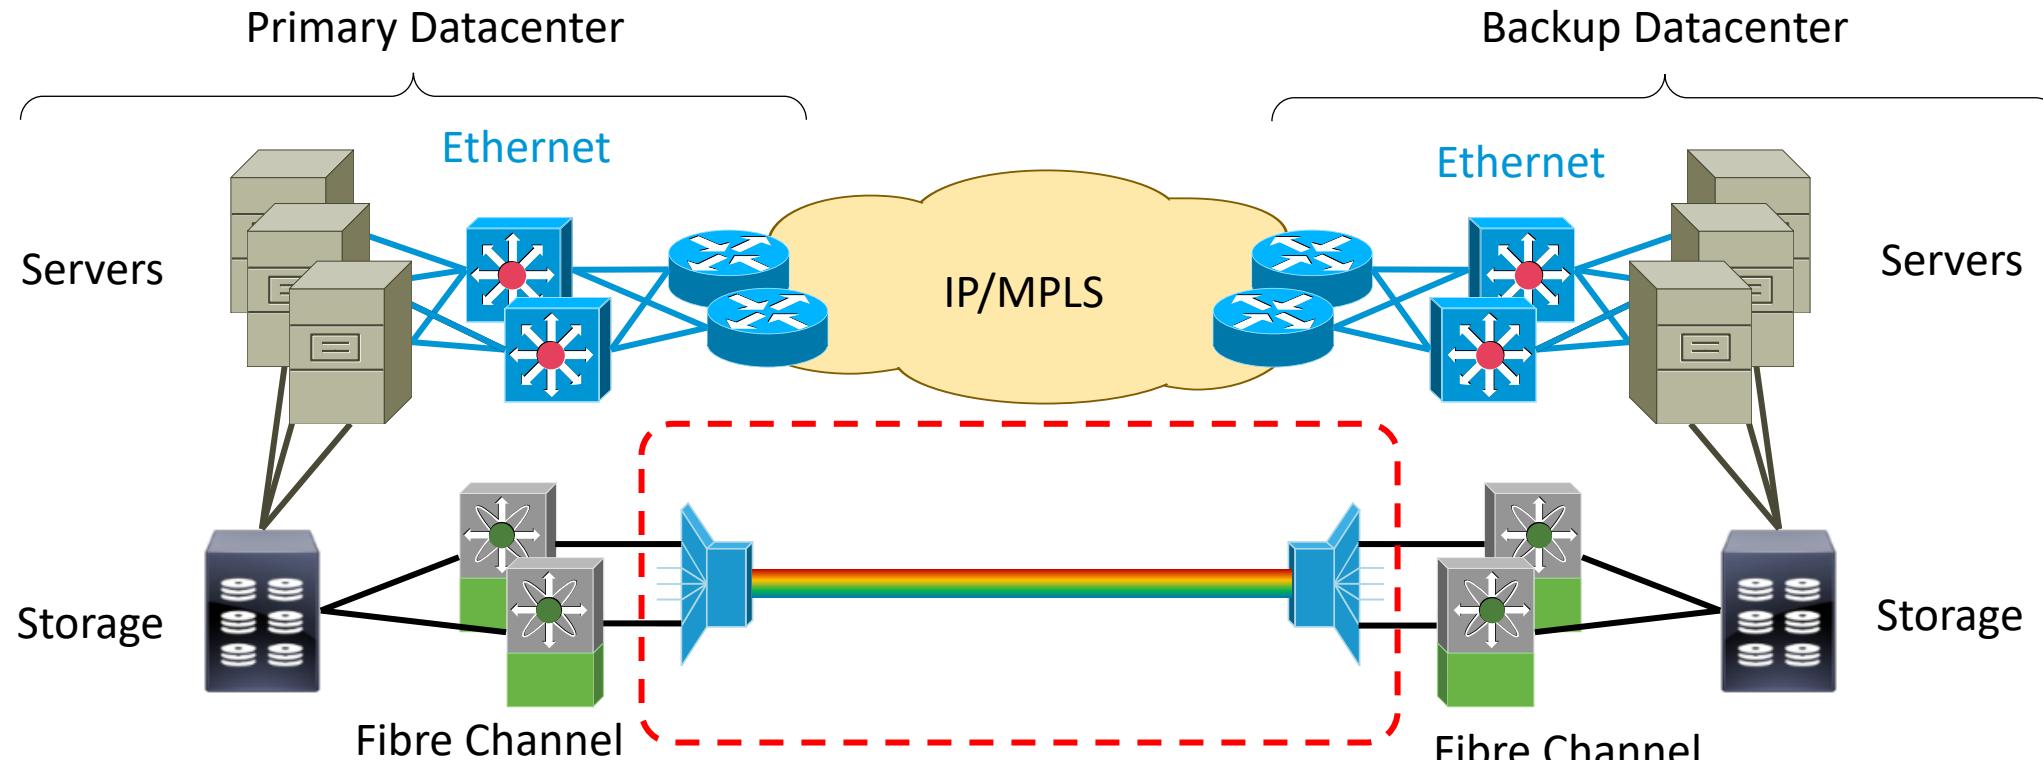

Reference Model

PLE Control Word

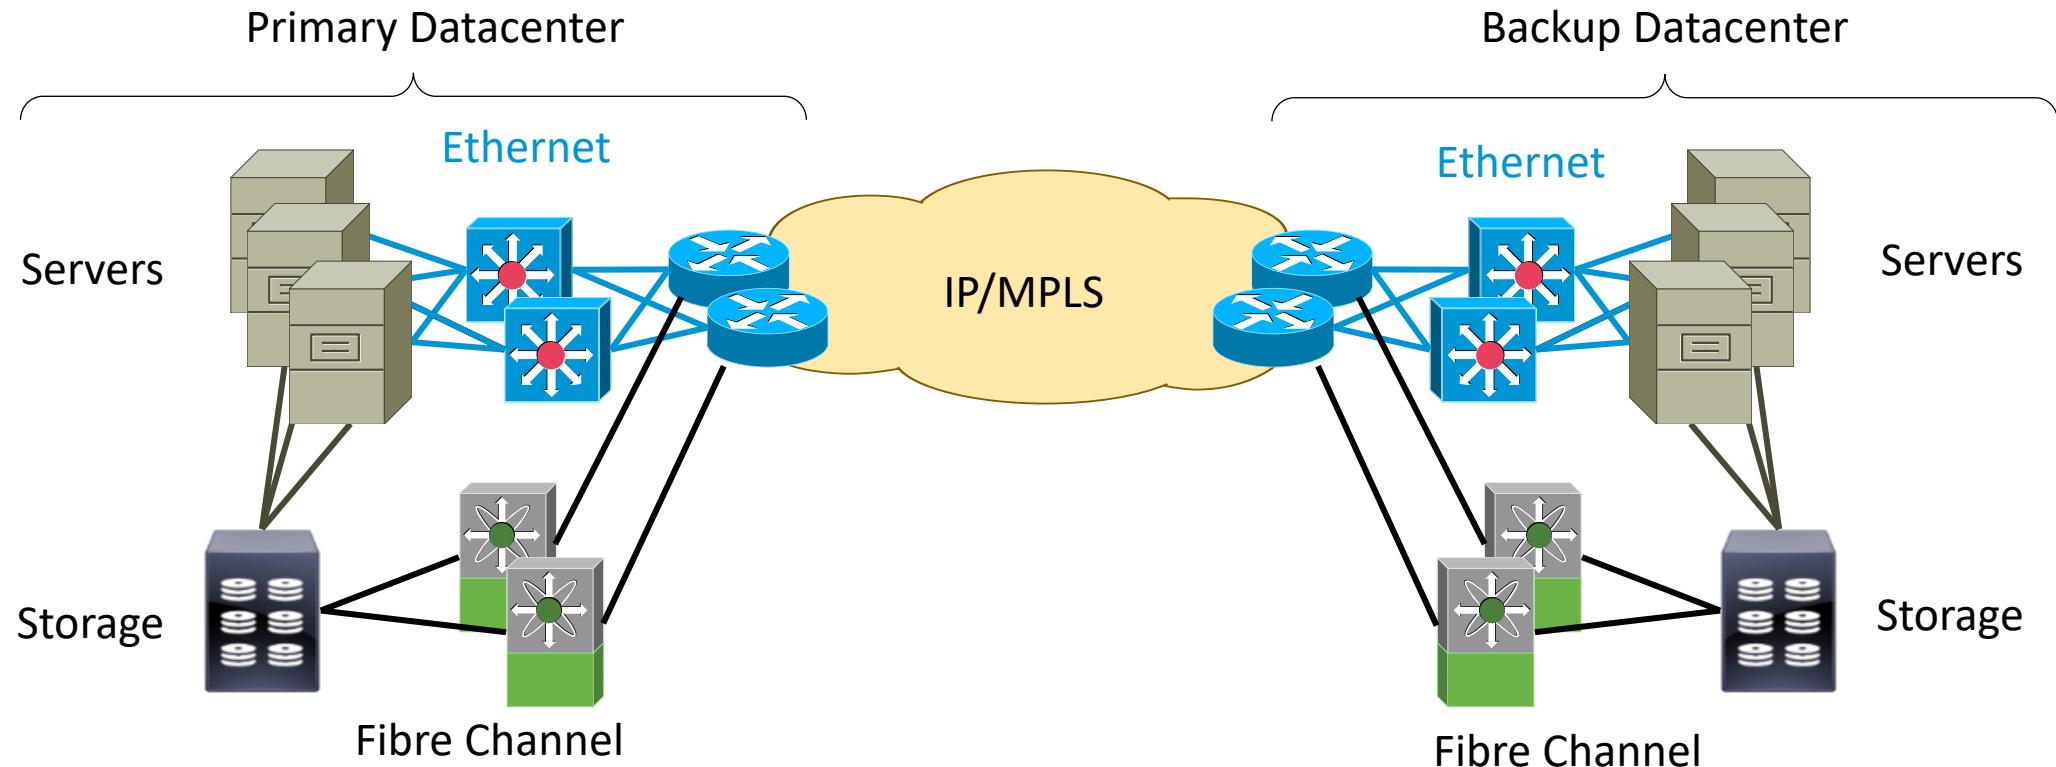

Use Case : Separate Storage Interconnect via DWDM

Dedicated network, often
managed service offering

Use Case : Storage over a converged IP/MPLS Network

What's new in draft-ietf-pals-ple-01 ?

- Addressed
 - comments (clock requirements) from Alexander Vainshtein
 - extensive review feedback from Erik van Veelen
 - review edits from Christopher Brown
- Worth to highlight (including changes in -00)
 - Revised Figure 2 and text around clock requirements
 - New section on Energy Efficient Ethernet
 - Rate compensation for 200GBASE-R and 400GBASE-R
 - Clarified NSP functions for OTN services

Signaling Bit-stream Pseudowires via LDP

- Existing work
 - RFC 5287 does specify extensions for SAToP (RFC 4553) and CESoP (RFC 5086)
 - CEP specifics are directly defined in section 12 of RFC 4842
- Proposal ([draft-schmutzer-pals-ple-signaling](#))
 - Follow the approach of RFC 5287 and RFC 4842
 - new PW type for PLE to be allocated by IANA
 - Reuse CEP/TDM payload bytes as is to negotiate a common payload size
 - Reuse CEP Options and CEP/TDM Bit-rate sub-TLVs to identify AC type unambiguously
 - [Introduce new Endpoint-ID sub-TLV](#)
 - To ensure correct pair of ACs is connected (Similar to Trail Trace Identifier (TTI) in OTN)

Signalling Bit-stream Pseudowire via BGP

- Leverage existing EVPN-VPWS [RFC8214] mechanisms plus ensure that
 - Same pseudowire type, AC type and payload size on both ends
 - Correct pair of ACs is connected
- Solution to cover all bit-stream pseudowires: PLE, SAToP, CESoP and CEP

Requirement	EVPN-VPWS New BGP Bitstream Attribute with TLVs	LDP
Pseudowire type	PW Type	PW Type ¹⁾ [RFC 8077]
Payload size	PLE/CEP/TDM Payload Bytes	CEP/TDM Payload Bytes ²⁾ [RFC 5287]
Attachment circuit type	PLE/CEP/TDM Bit-rate	CEP/TDM Bit-rate ²⁾ [RFC 5287]
	PLE/CEP Options	TDM Options ²⁾ [RFC 5287] CEP Options ²⁾ [RFC 4842]
Attachment circuit pair	Endpoint-ID	Endpoint-ID [draft-schmutz-pals-ple-signaling]

1) PWid or generalized PWid FEC element

2) LDP Interface Parameters sub-TLVs

Next Steps

- So far the focus was on the PLE dataplane
 - work got adopted in PALS as [draft-ietf-pals-ple](#) and is progressing well
- Looking at signaling aspects now more closely
 - [draft-schmutzer-bess-bitstream-vpws-signalling](#) is defining required extensions for EVPN-VPWS for both PLE and existing TDM pseudowires
 - [draft-schmutzer-pals-ple-signaling](#) addresses LDP extensions for PLE
- Appreciate your review and comments on
 - [draft-ietf-pals-ple-01](#)
 - [draft-schmutzer-pals-ple-signaling-00](#)
