Proxy Operations for CoAP Group Communication

draft-ietf-core-groupcomm-proxy-01

Marco Tiloca, RISE **Esko Dijk**, IoTconsultancy.nl

IETF 119 Meeting – Brisbane – March 20th, 2024

Recap

> Adopted as WG document in December 2023

> Scope: definition of proxy operations for CoAP group communication

- Signaling protocol between client and proxy, with two new CoAP options
- Individual responses from the CoAP servers are relayed back to the client
- Support for forward-proxies, reverse-proxies, chain of proxies, and HTTP-CoAP proxies
- Updated CoAP freshness model and validation model for cached responses in groups

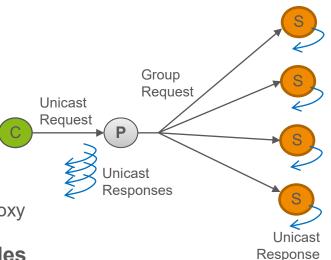

> The proxy is explicitly configured to support group communication

- Clients are allowed-listed on the proxy, and identified by the proxy

> Address issues discussed in Section 3.5 of draft-ietf-core-groupcomm-bis

Gist of the protocol

- In the <u>unicast</u> request addressed to the proxy, the client indicates:
 - To be interested / capable of handling multiple responses
 - For how long the proxy should collect and forward responses
 - In the new CoAP option Multicast-Timeout, removed by the proxy
- In each response to the group request, the proxy includes addressing information <u>pertaining to</u> the server
 - In the new CoAP option **Reply-To** (old name: Response-Forwarding)
 - The client can distinguish responses and different servers
 - The client may later contact an individual server (directly if possible, or again via the proxy)
- > Group OSCORE can be used for end-to-end security between client and servers
- > Security is used between Client and Proxy, especially to identify the Client
 - (D)TLS or OSCORE (see *draft-ietf-core-oscore-capable-proxies*)

> Simple changes

- Editorial fixes and readability improvements
- IANA considerations: use the "Hypertext Transfer Protocol (HTTP) Field Name" registry

> Clarifications

- Definition of "individual request" in the terminology:
 - > A request that an origin client sends to a single origin server within a group, either directly, or indirectly via a proxy.
- UDP/IP multicast is the default transport
 - > Alternatives are possible but out of scope here, like in *draft-ietf-core-groupcomm-bis*

> Considered also the CoAP options Proxy-Cri and Proxy-Scheme-Number

- Defined in *draft-ietf-core-href*

> Addressed two points about <u>reverse-proxies</u> – Thanks, Christian!

- Resolution based on discussions at an interim meeting [1] and on the mailing list [2]

> Point #1

- The unicast request from the client has always to include the Multicast-Timeout Option
 - > Otherwise, the proxy replies with an error. Client then includes the option
 - > The client does not assume a default, pre-configured timeout at the proxy

> Point #2

- To specify forwarding instructions, do not use a method like the one in RFC 8075
 - > That is, do not use Uri-Path Options to convey host/port information
 - > Use the Uri-Host and Uri-Port Options instead, as expected in CoAP
- Revised the example in Appendix A.1 (efficient proxy with a single IP address)

Reply-To Option (old name: Response-Forwarding)

> Clarified meaning of the option value

- Addressing information pertaining to the origin server that generated the response
 - > The client can use it to send an individual request intended to that server
- Rationale: if the client sends a follow-up request using that information, then the request will eventually reach that origin server. (Different cases in a later slide)

> Name "Reply-To": short, memorable, and aligned with the intended meaning

- <u>No intent</u> to suggest/recommend/trigger a follow-up request always
- The client can use it to distinguish responses from different origin servers
- Possible alternative names: "Resp-From", "Proxied-Response", "Responder-Locator", ...

Reply-To Option (old name: Response-Forwarding)

> New encoding of the option value, using CRIs [3]

- Binary serialization of a CBOR Sequence, of at most two elements
 - 1. REQUIRED: a CRI, with only the 'scheme' and 'authority'
 - 2. OPTIONAL: a CRI reference
 - With 'scheme' set to null, and at least one of 'authority' and 'path' given
 - Useful only for particular setups with a reverse-proxy (see later slide)
- > A proxy adds the option to the response as soon as possible
 - If the proxy caches responses, then a cached response has the option included
- > Revised encoding of the corresponding HTTP header field
 - Now a base64url string without padding, encoding the value of the CoAP option

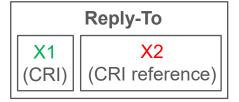

Reply-To Option used in different setups

> Forward-proxy

- X1 : actual address ADDR_S of the origin server; X2 : not used
- As a follow-up, the client can:
 - > Send a request to ADDR_S and directly reach the server; or
 - > Send a request to the proxy, specifying ADDR_S with the proxy-related options

> Reverse-proxy, hiding the group <u>but not</u> the individual servers

- X1 : actual address ADDR_S of the origin server; X2 : not used
- The client can send a follow-up request to ADDR_S and directly reach the server

Reply-To Option used in different setups

Reply-To	
X1	X2
(CRI)	(CRI reference)

> Reverse-proxy, hiding the group and also the individual servers

- X1 : <u>an</u> address ADDR_P of the proxy
- X2 (if present) : components to use in the Uri-Host/Uri-Port/Uri-Path Options
- The client can send a follow-up request to ADDR_P
 - > If X2 is used, the request has that information as Uri-Host/Uri-Port/Uri-Path Options
 - > X2 is good for a reverse-proxy with single IP address (see example in Appendix A.1)

> In a chain of such reverse-proxies

- As usual, the last proxy adjacent to the origin server adds the option to the response
- Each other proxy receiving a response with Reply-To=TARGET_OLD:
 - > Replaces the option value with a new value TARGET_NEW, such that ...
 - > when receiving a request targeting TARGET_NEW, it is forwarded to TARGET_OLD

Next steps

> Some points to address in the next versions

- Cancellation of ongoing response forwarding
- Response revalidation between proxy and servers, when using Group OSCORE
 - > Placeholder note in Sections 7.2.1 and 7.2.2: introduce an outer ETag Option
 - > Perhaps it can be defined in *draft-amsuess-core-cachable-oscore* ?
- Enable response forwarding to an HTTP client via streamed delivery
 - > Using the HTTP Transfer-Coding:chunked
- Revisit and extend the RFC 8075 security considerations on HTTP-CoAP proxies
- Add examples with an HTTP-to-CoAP proxy
- Terminology alignment with draft-bormann-core-responses

> Comments and reviews are welcome!

Thank you!

Comments/questions?

https://github.com/core-wg/groupcomm-proxy

Updates since version -05 (1/3)

- > Last presentation, of version -05, at the CoRE interim on 2021-10-27
- > Version -06 submitted before IETF 113 (not presented)

> "Multicast-Timeout" Option

- Renamed from "Multicast-Signaling", as suggested by Carsten
- Max length reduced to 4 bytes, as suggested by Christian

> "Response-Forwarding" Option

- Updated semantics on port number "null" or absent (swapped)
- "null" --> same as destination port number of the group request
- absent --> default port number

Backup

(Note: old name "Response-Forwarding" is used)

Example with forward-proxy (1/2)

C I	P	S1	S2
<pre>Src: C_ADDR:C_PORT Dst: P_ADDR:P_PORT Proxi-URI { coap://G_ADDR:G_PORT/r } Multicast-Timeout: 60</pre>			
	Src: P_ADDR:P_PORT Dst: G_ADDR:G_PORT Uri-Path: /r 	>	->
	<pre>/* t = 0 : P starts accepting responses for this request */</pre>		

Example with forward-proxy (2/2)

C	P < Src: S1_ADDR:G_PORT Dst: P_ADDR:P_PORT	S1 S2
< Src: P_ADDR:P_PORT Dst: C_ADDR:C_PORT Response-Forwarding { [1, /*CoAP over UDP*/ #6.260(bstr(S1_ADDR)), null /* G_PORT */] }		
		2_ADDR:S2_PORT ADDR:P_PORT
<		
	P stops accepting this request *∕ │	

Example #1 with reverse-proxy (1/3)

- → C \rightarrow P: CoAP over TCP
- p.example.com resolves to the address of P
- group1.com resolves to the multicast address of the group
- The proxy hides the group as a whole and the individual servers

ł		\$1	52
Src: C_ADDR:C_PORT Dst: p.example.com:P_PORT Uri-Path: /cp/coap://group1.com/r Multicast-Timeout: 60	/* C embeds the group URI into its request to the proxy */		
	Src: P_ADDR:P_PORT Dst: G_ADDR:G_PORT Uri-Path: /r 	>	>
	/* t = 0 : P starts accepting responses for this request */		

Example #1 with reverse-proxy (2/3)

- > $C \rightarrow P$: CoAP over TCP
- p.example.com resolves to the address of P
- group1.com resolves to the multicast address of the group
- The proxy hides the group as a whole and the individual servers
- Dx_ADDR:Dx_PORT is mapped to address and port of server Sx

	Р 9	S1 S2
	<pre>< Src: S1_ADDR:S1_PORT Dst: P_ADDR:P_PORT</pre>	
< Src: p.example.com:P_PORT Dst: C_ADDR:C_PORT Response-Forwarding { [3, /*coAP over TCP*/ #6.260(bstr(S1_ADDR)), S1_PORT] }

<pre>< Src: p.example.com:P_PORT Dst: C_ADDR:C_PORT Response-Forwarding { [3, /*CoAP over TCP*/ #6.260(bstr(S2_ADDR)), S2_PORT] }</pre>		
	P stops accepting this request */	

Example #1 with reverse-proxy (3/3)

- > C→P: CoAP over TCP
- p.example.com resolves to the address of P
- group1.com resolves to the multicast address of the group
- The proxy hides the group as a whole and the individual servers
- Dx_ADDR:Dx_PORT is mapped to address and port of server Sx

(C F)	S1	5
	Src: C_ADDR:C_PORT Dst: p.example.com:P_PORT Uri-Path: /cp/coap:// [S1_ADDR]:S1_PORT/r2	/* Request intended only to S1, via proxy P */		
		Src: P_ADDR:P_PORT Dst: S1_ADDR:S1_PORT Uri-Path: /r2	>	
		< Src: S1_ADDR:S1_PORT Dst: P_ADDR:P_PORT	-	
	<			

Example #2 with reverse-proxy (1/3)

> $C \rightarrow P$: CoAP over TCP

> group1.com resolves to the address of P

 The proxy hides the group as a whole and the individual servers

> Src: C_ADDR:C_PORT Dst: group1.com:P_PORT Uri-Path: /r	/* C is not aware that P is in fact a reverse-proxy */	S1	S
< Src: groupl.com:P_PORT Dst: C_ADDR:C_PORT 4.00 Bad Request Multicast-Timeout: (empty) Payload: "Please use Multicast-Timeout"			
Src: C_ADDR:C_PORT Dst: group1.com:P_PORT Multicast-Timeout: 60 Uri-Path: /r			
	Src: P_ADDR:P_PORT Dst: G_ADDR:G_PORT Uri-Path: /r \ \	>	->
	/* t = 0 : P starts accepting responses for this request */		

Example #2 with reverse-proxy (2/3)

> C→P: CoAP over TCP

 group1.com resolves to the address of P

 The proxy hides the group as a whole and the individual servers

Dx_ADDR:Dx_PORT is mapped to address and port of server Sx

i i	p 	S1 S
	< Src: S1_ADDR:S1_PORT Dst: P_ADDR:P_PORT	
< Src: groupl.com:P_PORT Dst: C_ADDR:C_PORT Response-Forwarding { [3, /*CoAP over TCP*/ #6.260(bstr(D1_ADDR)), D1_PORT] }		
< Src: group1.com:P_PORT Dst: C_ADDR:C_PORT Response-Forwarding { [3, /*CoAP over TCP*/ #6.260(bstr(D2_ADDR)), D2_PORT] }		
	 P stops accepting this request */	

Example #2 with reverse-proxy (3/3)

→ C \rightarrow P: CoAP over TCP

- group1.com resolves to the address of P
- The proxy hides the group as a whole and the individual servers

Dx_ADDR:Dx_PORT is mapped to address and port of server Sx

	/* time passes */
Src: C_ADDR:C_PORT Dst: D1_ADDR:D1_PORT Uri-Path: /r	-> /* Request intended only to S1 for same resource /r */
	Src: P_ADDR:P_PORT Dst: S1_ADDR:S1_PORT Uri-Path: /r
	< Src: S1_ADDR:S1_PORT Dst: P_ADDR:P_PORT
<pre><src: c_addr:c_port<="" d1_addr:d1_port="" dst:="" pre=""></src:></pre>	 r

Example with HTTP-CoAP proxy

POST https://proxy.url/hc/?target_uri=coap://G_ADDR:G_PORT/ HTTP/1.1 Content-Length: <REQUEST_TOTAL_CONTENT_LENGTH> Content-Type: text/plain Multicast-Timeout: 60

HTTP/1.1 200 OK Content-Length: <BATCH_RESPONSE_TOTAL_CONTENT_LENGTH> Content-Type: multipart/mixed; boundary=batch_foo_bar

--batch_foo_bar Content-Type: application/http

HTTP/1.1 200 OK Content-Type: text/plain Content-Length: <INDIVIDUAL_RESPONSE_1_CONTENT_LENGTH> Response-Forwarding: coap://S1_ADDR:G_PORT

Body: Done! --batch_foo_bar Content-Type: application/http

HTTP/1.1 200 OK Content-Type: text/plain Content-Length: <INDIVIDUAL_RESPONSE_2_CONTENT_LENGTH> Response-Forwarding: coap://S2_ADDR:S2_PORT

Body: More than done! --batch_foo_bar-- $C \rightarrow P$: HTTP unicast group request

- P converts it to a CoAP group request
- Forwarded to coap://G_ADDR:G_PORT
- > P accepts responses for 60 s
- > S1 \rightarrow P : CoAP response
 - Converted to HTTP and stored
- > S2 \rightarrow P : CoAP response
 - Converted to HTTP and stored

... ... TIMEOUT!

> P prepares one HTTP "batch" response

 Include the different individual responses, one for each replying server

> P → C : HTTP "batch" response

 C extracts the individual HTTP responses from the "batch" response
