

JMAP Sieve

draft-ietf-jmap-sieve-19

Ken Murchison

Status

- Has gone through a partial IESG review (missing SECDIR)
- Substantial editorial changes based on the feedback

Changes since IETF 118

- Removed the statement that JMAP Sieve functionality differs from ManageSieve
- Merged the Terminology subsection into the Notational Conventions section
- Added an example JMAP Sessions object which is referenced by other examples
- Removed the discussion of script content from the “blobId” description and into a new Script Content section

Changes since IETF 118

- Stripped JMAP API examples down to just “methodCalls” and “methodResponses”
- Renamed the “invalidScript” and “scriptsActive” SetErrors to “invalidSieve” and “sieveIsActive” respectively
- Added a new section discussing Quotas:
 - Servers SHOULD impose them
 - Administration is out of scope
 - RFC 9425 can be used by clients to get quota info

Outstanding Issues

- “JMAP API Request (and response)” vs “methodCalls” and “methodResponses”

Next Steps

- Please review the new text to make sure that it doesn't make any technical changes
- Another WGLC?
