OAuth 2.0 Protected Resource Metadata

<https://datatracker.ietf.org/doc/html/draft-ietf-oauth-resource-metadata-03>

What is this for?

- See presentation from IETF 118
 - <https://datatracker.ietf.org/meeting/118/materials/slides-118-oauth-oauth-20-protected-resource-metadata>

Progress Since IETF 118

- Switched from concatenating `.well-known` to the end of the resource identifier to inserting it between the host and path components of it
 - As we also had to do in AS Metadata spec [RFC 8414]
- Changed to have `WWW-Authenticate` return `resource_metadata` URL rather than resource identifier
 - Per the direction requested by the working group
- Applied a correction by Filip Skokan

- All open issues have been addressed. See the closed issues at:
<https://github.com/oauth-wg/draft-ietf-oauth-resource-metadata/issues?q=is%3Aissue+is%3Aclosed>

Next Steps

- Time for working group last call?
