

Extensible Provisioning Protocol (EPP) mapping for DNS Time-To-Live (TTL) values

Gavin Brown
Principal Engineer, GDS Technical Services
regext WG, IETF119, Brisbane
19 March 2024

Quick Recap

- Allows EPP clients to specify TTL values for DNS records above the zone cut
- Adopted by the WG in 2023, due for RFC publication in May

Changes since IETF 118 Prague

- The `<info>` command works differently: no `<ttd:ttl>` elements are returned unless the `<ttd:info>` element is used in the command
- `<ttd:info>` has a `policy` attribute:
 - `policy="false"` (*default*):
 - `<ttd:ttl>` records included for types with non-default values
 - `min/default/max` attributes are not included
 - `policy="true"`
 - `<ttd:ttl>` records included for types with non-default values
 - `min/default/max` attributes are included

Current status

- Version -07 is ready for publication with feedback received to date.
- After this is published, I **think** this document is ready for WGLC.
