

Privacy Pass Extensions

Scott Hendrickson, Christopher Wood, Ghous Amjad, Kevin Yeo, Steven Valdez

IETF 120 - Privacy Pass

Review

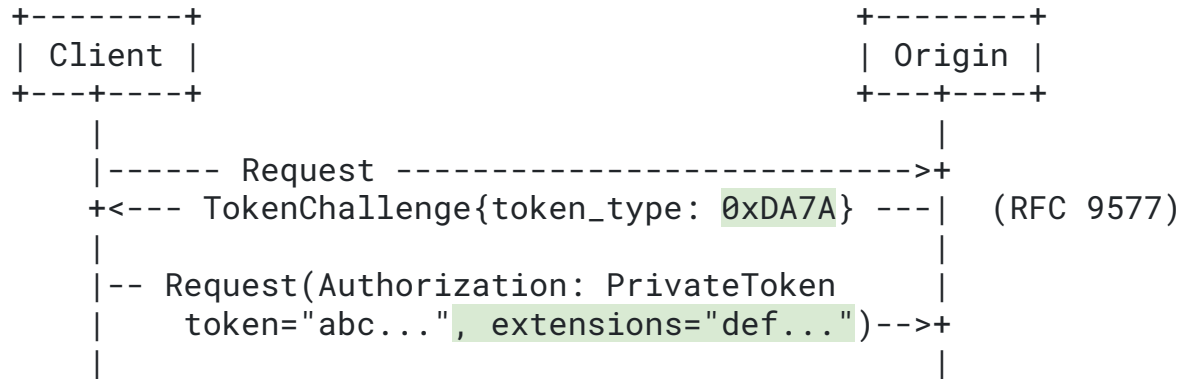

- Two drafts adopted:
- [draft-ietf-privacypass-auth-scheme-extensions](#)
 - Adds an **extensions** parameter of PrivateToken:
Authorization: PrivateToken token="abc..." extensions="def..."
- [draft-ietf-privacypass-public-metadata-issuance](#)
 - Defines privately (POPRF) and publicly (PBRSA) verifiable public metadata mechanisms

Status

RSA Signatures with Public Metadata

- Chrome [IP Protection](#) Authentication (including [Expiration Extension](#))
- [Pixel VPN](#) Authentication
- [Third-party audit of Cryptography](#)

Extension Flow

- `token_type` defines cryptographic protocol used
 - standardized in [draft-ietf-privacypass-public-metadata-issuance](#)
- `extensions="..."`
 - content is not yet standardized (example: [Expiration Extension](#))
 - negotiation is not yet standardized
 - consider a TokenChallenge extension?
 - see [auth-scheme-extensions sec 4](#) discussion

Proposal: Extension Negotiation

```
+-----+
| Client |
+-----+
|
|----- Request ----->+
+<-- TokenChallenge{token_type: 0xDA7A,
|     extensions: [extension_type: 0x0001, 0x0002]} --|
|
|--- Request(Authorization: PrivateToken
|     token="abc...", extensions="def...")----->+
|
|
```

- Image starts from [draft-ietf-privacypass-auth-scheme-extensions](#)
- adds a set of extensions requested by origin
- client can choose to present a subset
- reminder: the extensions presented add [more entropy](#)

Path to WGLC

- Partially Blind RSA adoption
 - Presenting again at CFRG (Thursday session)
 - Prior adoption call requested privacy pass draft usage
 - Negotiate extensions, or not (previous slide)
- + Bonus: Adopt Expiration Extension in Privacy Pass?

Thank you!

IETF 120 - Privacy Pass

ExpirationTimestamp

- Expiration and key rotation are interchangeable
- Key rotation is difficult to perform quickly
- [draft spec](#)

```
struct ExpirationTimestamp {  
    uint64_t timestamp_precision;  
    uint64_t timestamp;  
}
```

all readers should
verify safe rounding
