

Careful Resume Experiment @ Fastly - IETF 121

- goal: confirm CR works well enough, even when it fails to guess BW
- idea: run CR with 60 packets without previous information, and see
- setup:
 - one server at a POP in Europe
 - split HTTP/3 connections into 3 groups: CR60, IW30 (baseline), IW60
 - look only at connections with 1st HTTP response $\geq 200\text{KB}$, served from local cache, excluding receiver-window-blocked connections (i.e., enough pressure to CC)
 - collect TTLB of such HTTP responses (from when the request is received until when all the bytes of the response are ACKed)

TTLB of 1st response (cached only; $\geq 200\text{KB}$)

packet loss ratio (%)
