draft-ietf-cdni-protected-secrets-metadata-05

Recap from IETF 123

Kevin:

- can we just change the name of the metadata to not include HCV, and let it be for any external store that only needs an endpoint, namespace, and version, and add a small appendix that says how you can use the generic endpoint, namespace, and version to connect to HCV?

Ben:

- I think it can work. I will have to go back to the document. I might need to add a 4th property to hold generic "other" store config properties if we're going to support it generically.
