EAI address syntax

- draft-ietf-mailmaint-interoperable-addresses-02
- draft-ietf-mailmaint-smtputf8-syntax-02

Quick overview

- One document defines a minimal syntax, just enough to match requests for human addresses
  - Mostly for provisioning
- One document defines a larger, simpler syntax, but risk-free, even for unicode non-experts
  - e.g. for checking before rendering incoming mail

Current status

- Uses PRECIS for much work
- One implementation ongoing
- Gathering tests for a test suite
- Decided to ignore some open issues
- One open issue left

Open issues

- Length limits for localparts: simply reiterate 64 bytes?
- Metal umlauts: tend to want to ignore
- Mixed LTR-RTL domains: want to ignore

Future

- Want to do an implementation myself
- Maybe WGLC at next meeting
- ... assuming two implementations exist
- Review, please
