DNS and PREF64 Configuration for Proxying IP in HTTP

`draft-ietf-masque-connect-ip-dns-05`

David Schinazi

Yaroslav Rosomakho*

MASQUE

IETF124, November 2025, Montreal

Quick recap...

- This is NOT a new way to transport DNS or perform NAT64
- This is about signaling DNS resolver **and PREF64** configuration over capsules to get on par with traditional VPNs

Changes from -04

- Added new PREF64 Capsule
- Similar to PREF64 from RFC8781 (Discovering PREF64 in RA)
- No lifetimes since sender can always send fresh Capsule reliably
- Multiple PREF64 prefixes MAY be included
- No PREF64 prefixes MAY be included (invalidate previous PREF64 configuration)

PREF64 Capsule

```
PREF64 Capsule {  
  Type (i) = PREF64,  
  Length (i),  
  NAT64 Prefix (104) ...,  
}
```

```
NAT64 Prefix {  
  Prefix Length (8),  
  Prefix (96)  
}
```

Unlike RA encoding we have the luxury of a whole byte instead of 3 bits

PL	0	32	40	48	56	64	72	80	88	96	104
32	prefix	v4(32)					u		suffix		
40	prefix	v4(24)					u	(8)	suffix		
48	prefix		v4(16)				u	(16)	suffix		
56	prefix			(8)		u		v4(24)	suffix		
64	prefix					u		v4(32)	suffix		
96	prefix									v4(32)	

Always 96 bits long. “Prefix length” determines where to insert IPv4 address as explained in section 2.2 of RFC6052

As far as we know nobody actually uses non-zero suffix but some people do use Prefix Length other than 96 bits
