The Problem - SAV Visibility Gap

❑ **SAV is fundamental defense against IP spoofing, but current implementations **lack operational visibility.****

● Critical questions need to be answered:

- How many spoofed packets are detected and dropped?
- From which interfaces do spoofed packets arrive?
- Which specific SAV rules trigger enforcement?
- Are SAV rules functioning correctly?

Solution Overview - IPFIX SAV Telemetry

□ Approach

- Extends IPFIX protocol for SAV-specific telemetry

□ Objectives

- Capturing validation context and outcomes
- Identification of validation modes and triggering rules
- Reporting policy actions on spoofed packets

□ Design Principles

- ◆ Conceptual Alignment with the SAV concepts and validation modes [*draft-ietf-savnet-general-sav-capabilities*]
- ◆ Semantic Correlation to the SAV YANG data model

SAV Validation Modes

❑ Four Canonical Modes defined in the general SAV capabilities framework

◆ Interface-based Validation

- **Mode 1:** Prefix Allowlist: "On interface X, what prefixes are allowed?"
- **Mode 2:** Prefix Blocklist: "On interface X, what prefixes are blocked?"

◆ Prefix-based Validation

- **Mode 3:** Interface Allowlist: "For prefix Y, which interfaces are allowed?"
- **Mode 4:** Interface Blocklist: "For prefix Y, which interfaces are blocked?"

Core Information Elements (IE)

Name	Abstract Data Type	Description
savRuleType	unsigned8	Identifies the rule as an Allowlist or Blocklist. <i>"What kind of rule was triggered?"</i>
savTargetType	unsigned8	Specifies if the rule is Interface-based or Prefix-based. <i>"Was the lookup key an Interface or a Prefix?"</i>
savMatchedContentList	subTemplateList	Carries the content of the SAV rules relevant to the decision. <i>"Which specific rule(s) were evaluated?"</i>
savPolicyAction	unsigned8	Reports the action applied to spoofed packets. <i>"What was done to the packet?"</i>

Key Design - Rule Context Capture

❑ These IEs work together to provide detailed context. `savRuleType`, `savTargetType`, and `savPolicyAction` describe the what and how, the `savMatchedContentList` explains the why.

❑ Capturing the specific SAV rules: The `savMatchedContentList` IE, encoded as a `subTemplateList` [RFC6313], acts as a container for structured SAV rule data.

**Example: An IPv4 allowlist non-match event. The list contains all SAV rules in the allowlist that were checked, showing the packet matched none (allOf).*

Key Design - Sub-Templates for SAV Rules

□ `savMatchedList` Element

- ◆ Each entry in the `savMatchedList` is a complete SAV rule.
- ◆ Four sub-templates are defined to cover IPv4/6 address families and validation modes.

Sub-Template ID (exporter assign)	Usage	Key Fields (Rule Configuration)
901	IPv4 Interface-to-Prefix (Modes 1 & 2)	ingressInterface sourceIPv4Prefix sourceIPv4PrefixLength
902	IPv6 Interface-to-Prefix (Modes 1 & 2)	ingressInterface sourceIPv6Prefix sourceIPv6PrefixLength
903	IPv4 Prefix-to-Interface (Modes 3 & 4)	sourceIPv4Prefix ingressInterface sourceIPv4PrefixLength
904	IPv6 Prefix-to-Interface (Modes 3 & 4)	sourceIPv6Prefix ingressInterface sourceIPv6PrefixLength

Use Cases

□ SAV Enforcement Monitoring:

- ◆ Quantify spoofing attempts per rule type
- ◆ Track SAV effectiveness over time

□ Rule-Level Attribution and Troubleshooting:

- ◆ Identify exact SAV rule configurations
- ◆ Audit rule correctness and coverage

□ Forensic Analysis and Compliance:

- ◆ Correlate SAV Data Records with other data sources for incident investigation and compliance reporting.

Operational Considerations

□ For Exporters:

- ◆ encode the subTemplateList structure and ensure semantic
- ◆ define the sub-templates used within the subTemplateList before exporting data

□ For Collectors:

- ◆ parsing the `subTemplateList` and understanding the context-dependent semantics

□ IPv4/IPv6 support:

- ◆ separate, dedicated sub-templates

Example - Scenario Setup

Two Observed SAV Validation Events

Event ID	Source Address	Ingress Interface	Rule Type	Target Type	Policy Action
1	192.0.2.100	5001	Allowlist	Interface	Discard
2	2001:db8::1	5001	Blocklist	Prefix	Discard

◆ Event 1: IPv4 Allowlist Non-Match

- Source IP 192.0.2.100 not in any allowed prefixes for interface 5001
- Policy: rate limit

◆ Event 2: IPv6 Blocklist Match

- Interface 5001 explicitly blocked for prefix 2001:db8::/32
- Policy: discard packet

Example - Sub-Templates for Rule Content

◆ Sub-Template 901: IPv4 Interface-to-Prefix Mapping Rules

[illegible]

- Four different Sub-Templates (901-904) for:
 - IPv4 Interface-to-Prefix Mapping Rules
 - IPv6 Interface-to-Prefix Mapping Rules
 - IPv4 Prefix-to-Interface Mapping Rules
 - IPv6 Prefix-to-Interface Mapping Rules

Example - Data Export Details

●Template Example (ID 400)

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
|-----|-----|-----|-----|
| Set ID = 2 | Length = 28 | | |
|---|---|---|---|
| Template ID = 400 | Field Count = 5 |
|-----|-----|-----|-----|
| 0 | observationTimeMicrosec=324 | Field Length = 8 |
|-----|-----|-----|-----|
| 0 | savRuleType = TBD1 | Field Length = 1 |
|-----|-----|-----|-----|
| 0 | savTargetType = TBD2 | Field Length = 1 |
|-----|-----|-----|-----|
| 0 | savMatchedContentList=TBD3 | Field Length = 0xFFFF |
|-----|-----|-----|-----|
| 0 | savPolicyAction = TBD4 | Field Length = 1 |
|-----|-----|-----|-----|
```

●Data Set Example

```
0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1 2 3 4 5 6 7 8 9 0 1
|-----|-----|-----|-----|
| Set ID = 400 | Length = 88 |
|-----|-----|-----|-----|
| observationTimeMicrosec = |
|-----|-----|-----|-----|
| 0x5D2F0A0000000000 |
|-----|-----|-----|-----|
| savRuleType=0 | savTargetType=0 | 255 | List Length |
|-----|-----|-----|-----|
| = 33 | semantic=(allOf) | Template ID = 901 |
|-----|-----|-----|-----|
| ingressInterface[0] = 5001 |
|-----|-----|-----|-----|
| sourceIPv4Prefix[0] = 198.51.100.0 |
|-----|-----|-----|-----|
| sourceIPv4PrfLen[0]=24 | ingressInterface[1] = | | |
|---|---|---|---|
| 5001 | sourceIPv4Prefix[1] = |
|-----|-----|-----|-----|
| 203.0.113.0 | sourceIPv4PrfLen[1]=24 | ingressInterface[2] = |
|-----|-----|-----|-----|
| 5001 | sourceIPv4Prefix[2] = |
|-----|-----|-----|-----|
| 192.10.2.0 | sourceIPv4PrfLen[2]=24 | savPolicyAction=2 |
|-----|-----|-----|-----|
```

Event 1 Data Record: IPv4 Allowlist
Non-Match
(Sub-template list with 3 SAV rules,
highlighted in red)

```
|-----|-----|-----|-----|
| observationTimeMicrosec = |
|-----|-----|-----|-----|
| 0x5D2F0A0000000001 |
|-----|-----|-----|-----|
| savRuleType=1 | savTargetType=0 | 255 | List Length |
|-----|-----|-----|-----|
| = 27 | semantic=exactlyOneOf | Template ID = 904 |
|-----|-----|-----|-----|
| sourceIPv6Prefix[0] |
|-----|-----|-----|-----|
|-----|-----|-----|-----|
|-----|-----|-----|-----|
|-----|-----|-----|-----|
|-----|-----|-----|-----|
| sourceIPv6PrfLen[0]=32 | ingressInterface[0] = |
|-----|-----|-----|-----|
| 5001 | savPolicyAction=1 | padding |
|-----|-----|-----|-----|
```

Event 2 Data Record: IPv6 Blocklist
Match
(Sub-template list with 1 SAV rule,
highlighted in red)

Conclusion & Open Issues

□ Technical Summary:

- ◆ Fills critical operational **visibility** gap in SAV
- ◆ **Vendor-neutral implementation-independent** approach based on IPFIX
- ◆ Provides comprehensive **context for SAV** enforcement
- ◆ Enables effective monitoring, troubleshooting and threat analysis

□ Effective Impact and Potential Contributions

- ◆ **Operational Verification:** Confirm SAV is actively and correctly enforcing policies
- ◆ **Root-Cause Analysis:** Determine why specific packets were deemed invalid
- ◆ **Threat Intelligence:** Quantify spoofing attempts and analyzing attack patterns
