

Workload Identifier

draft-ietf-wimse-identifier-02

Yaroslav
Rosomakho*

Joe Salowey

WIMSE
IETF125, March 2026, Shenzhen

Key changes since -00

- Defined workload identifier origin ("`<scheme://trust-domain>`")
- Removed overlap with s2s credentials work
- Added URI requirements as discussed at IETF124
- Added wimse URI scheme definition
- Spelled out that identifier may apply to workload instances and logical workloads

Issue #24: WIMSE identifier scheme registry

- Do we need a separate registry for workload schemes or is regular IANA URI scheme registry good enough?

Issue #25: WIMSE scheme semantics

- Do we want additional wimse:// requirements or should we leave it flexible?
- Do we define separation notation for paths specific to individual workloads vs services

Issue #11: Align terminology

- We need to align terminology between all WIMSE documents and, ideally, have a single source of truth

Thank you!
