Background

> Assumptions

- Ethernet can be the PSN; therefore the tunnels can be Ethernet
 - Ethernet PSN is already being considered in TRILL, CCAMP etc. WGs
- PWs over Ethernet PSN are possible in a manner similar to PW over MPLS/IP PSN
 - To carry different native payloads
- MS-PWs may be deployed across Ethernet PSN (e.g. in Metro) and MPLS/IP PSN (e.g. in Core)

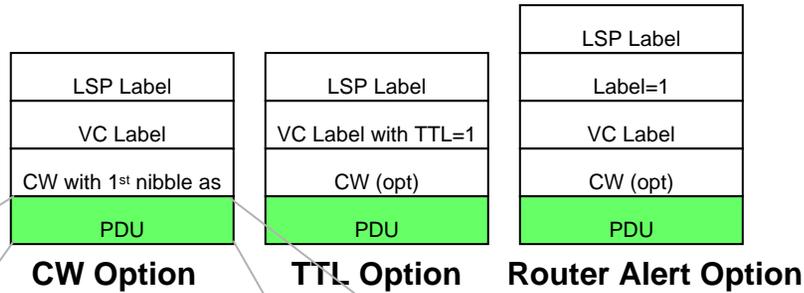

PWE3 SS-PW OAM Approach – MPLS PSN

- > Different monitoring points in the context of equipment model are shown
- > Service MEs for PW service provider include:
 - E2E-PW ME (associated with monitoring points marked "2" on PE)
 - AC ME (associated with monitoring point marked "1" on PE)
- > Network MEs for PW service provider include:
 - PSN ME (associated with monitoring points marked "3" on PE)
 - UNI ME (associated with monitoring point marked "4" on PE)

ME	OAM Mechanism	Comment
E2E-PW	VCCV channel, PW status	VCCV Payload is BFD/LSP Ping
PSN	LSP Ping, BFD	For MPLS PSN
UNI, AC, Customer ME	Native	Dependent on technology used

VCCV – control and payload

Version Number=1		Global Flags (1bit V* used)	
Msg Type	Reply Mode	Ret Code	Ret Subcode
Sender's Handle			
Sequence Number			
Sent Timestamp			
Received Timestamp			
TLVs			

LSP Ping

Ver =1	Diag	Sta P F C A D R	Detect Mult	Length
My Discriminator				
Your Discriminator				
Desired Min TX Interval (system would like to use)				
Required Min RX Interval (system can support for receive)				
Required Min Echo RX Interval (min int. for Echo, 0=no Echo supported)				

BFD

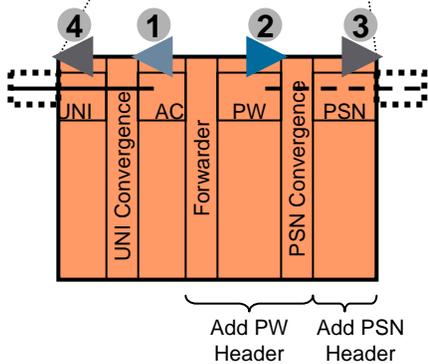

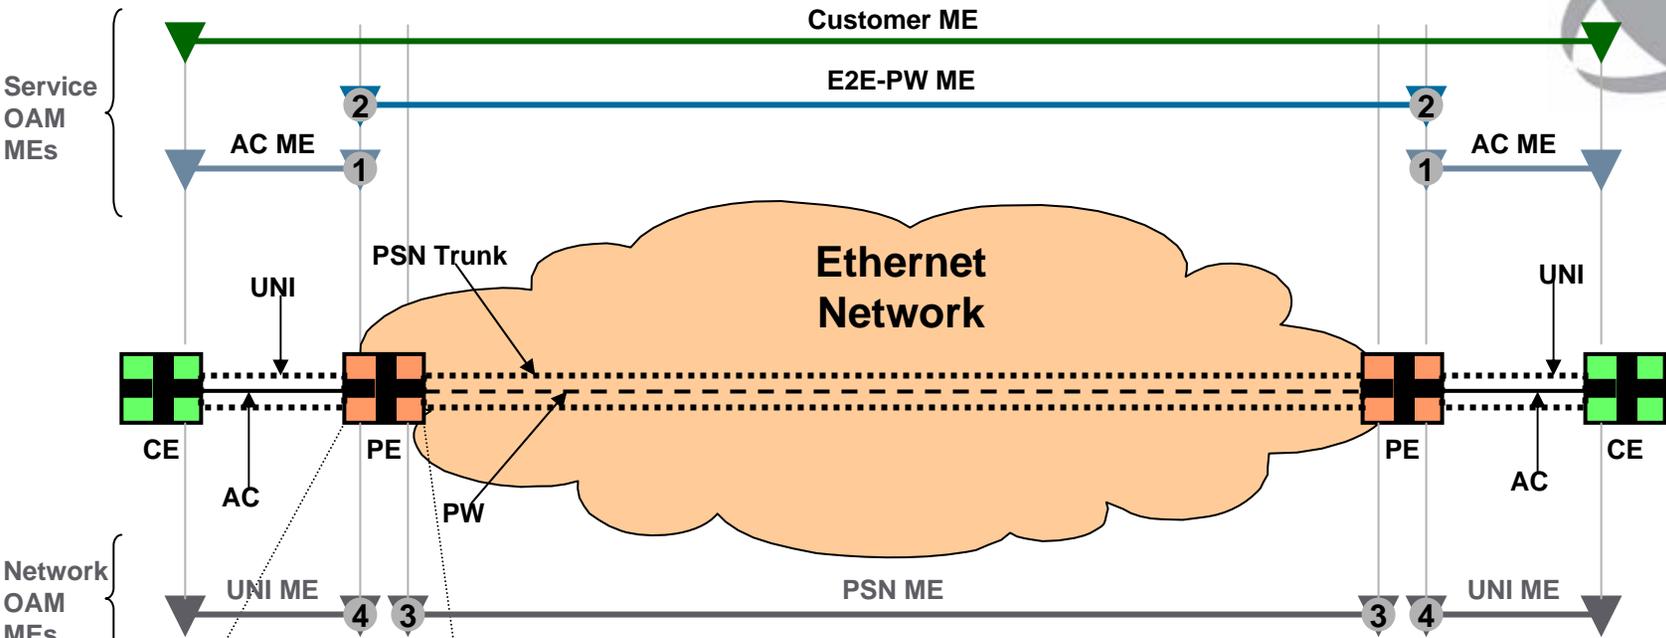

0x0c	0x04	CC Types	CV Types
------	------	----------	----------

- VCCV Parameter Field
 Parameter ID = 0x0c
 Length = 4
 CC Types = 0x01 control word with 1st nibble as 0x0001
 = 0x02 MPLS Router Alert Label
 = 0x04 MPLS PW Demultiplexor Label TTL=1
 CV Types = 0x01 ICMP Ping
 = 0x02 LSP Ping
 = 0x04 BFD for PW fault Detection only
 = 0x08 BFD for PW Fault Detection & AC/PW Status Signaling

- > **VCCV Capabilities/Options are assumed to be signaled at the time of establishing PW**
- > **VCCV parameter field is carried in:**
 - For FEC128 – in Interface parameters field
 - For FEC129 – sub-TLV in Interface parameter field

VCCV Capability Signaling

PWE3 SS-PW OAM Approach – Ethernet PSN

- > Different monitoring points in the context of equipment model are shown
- > Service MEs for PW service provider include:
 - E2E-PW ME (associated with monitoring points marked “2” on PE)
 - AC ME (associated with monitoring point marked “1” on PE)
- > Network MEs for PW service provider include:
 - PSN ME (associated with monitoring points marked “3” on PE)
 - UNI ME (associated with monitoring point marked “4” on PE)

ME	OAM Mechanism	Comment
E2E-PW	VCCV channel	Payload is Ethernet OAM
PSN	Ethernet OAM	For Ethernet PSN
UNI, AC, Customer ME	Native	Dependent on technology used

Ethernet OAM as VCCV PDU

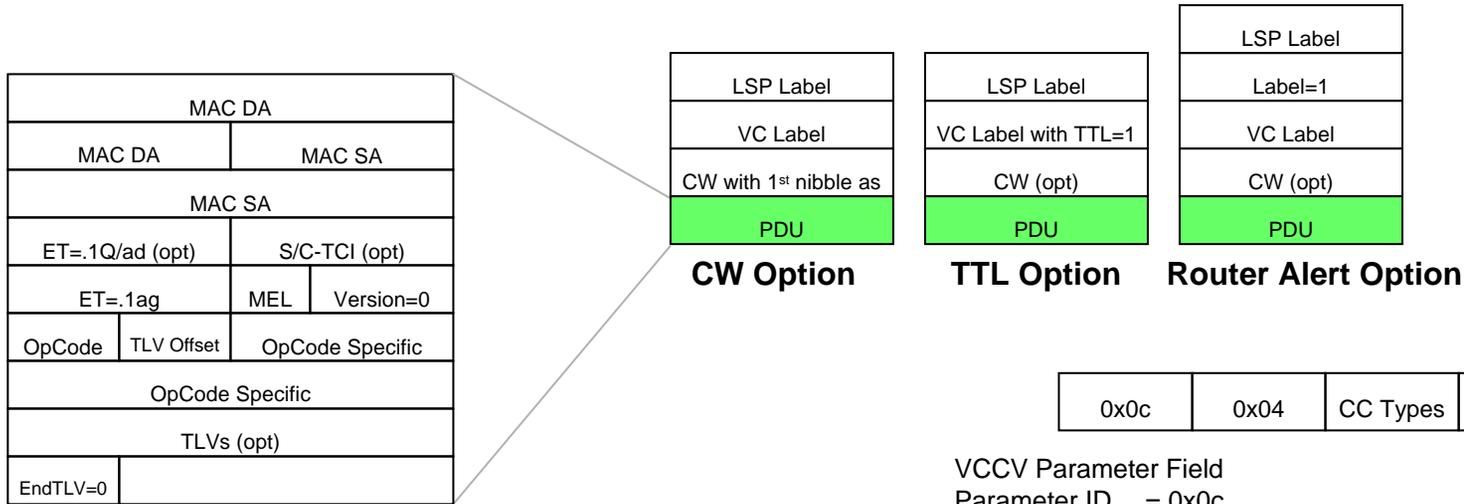

> Rationale

- When the PSN itself is Ethernet, PEs already implement Ethernet OAM
- Ethernet OAM (as defined in Y.1731 and draft 802.1ag) is quite functional
- Ethernet OAM supports upto 8 different MEG Levels allowing hierarchical maintenance domains as applicable in MS-PW
- BFD can be extended to match Ethernet OAM functionality OR Ethernet OAM itself can be used

> VCCV dependency

- Assuming that PW over Ethernet PSN continue to use VCCV as a generic maintenance channel, a capability to carry Ethernet OAM payload needs to be defined in VCCV
 - **Similar to LSP Ping, ICMP Ping, and BFD payloads**

VCCV – Ethernet OAM control and payload

Ethernet OAM values for VCCV application

- B-MAC DA = This could be dummy or might carry OAM specific multicast/Unicast address
- B-MAC SA = This could be dummy or might carry Tx MEP's Unicast address
- S/C-Tag (opt) = Optional forwarding TAG associated with service instance
- MEL = MEG Level (0-7) to identify the hierarchical domain
- Version = 0 (protocol version)
- OpCode = 0x01 CCM
- = 0x03 LBM
- = 0x02 LBR
- = 0x05 LTM
- = 0x04 LTR
- = 0x33 AIS
- = 0x37 TST
- = 0x39 APS
- = 0x41 MCC
- = 0x43 LMM
- = 0x42 LMR
- = 0x45 1DM
- = 0x47 DMM
- = 0x46 DMR

- VCCV Parameter Field
- Parameter ID = 0x0c
 - Length = 4
 - CC Types = 0x01 control word with 1st nibble as 0x0001
 - = 0x02 MPLS Router Alert Label
 - = 0x04 MPLS PW Demultiplexor Label TTL=1
 - CV Types = 0x01 ICMP Ping
 - = 0x02 LSP Ping
 - = 0x04 BFD for PW fault Detection only
 - = 0x08 BFD for PW Fault Detection & AC/PW Status Signaling
 - = 0x10 Ethernet OAM (.1ag & Y.1731)**

- > VCCV Capabilities/Options are signaled at the time of establishing the PW
- > VCCV parameter field is carried in:
 - For FEC128 – in Interface parameters field
 - For FEC129 – sub-TLV in Interface parameter field

VCCV Capability Signaling

Ethernet OAM

Next Steps

- > Proposal is to add the new “CV Types” code point to VCCV draft
- > Reference can be made to Ethernet OAM specifications, work does not need to be repeated in IETF
 - ITU-T Y.1731 – approved in May 2006
 - IEEE 802.1ag – draft recommendation – sub-set of Y.1731
- > Some appendix material to highlight the payloads for different functions using Y.1731/802.1ag can be added, if needed
- > Applications in MS-PWs can be addressed separately, as part of ongoing MS-PW OAM work

Backup Slides

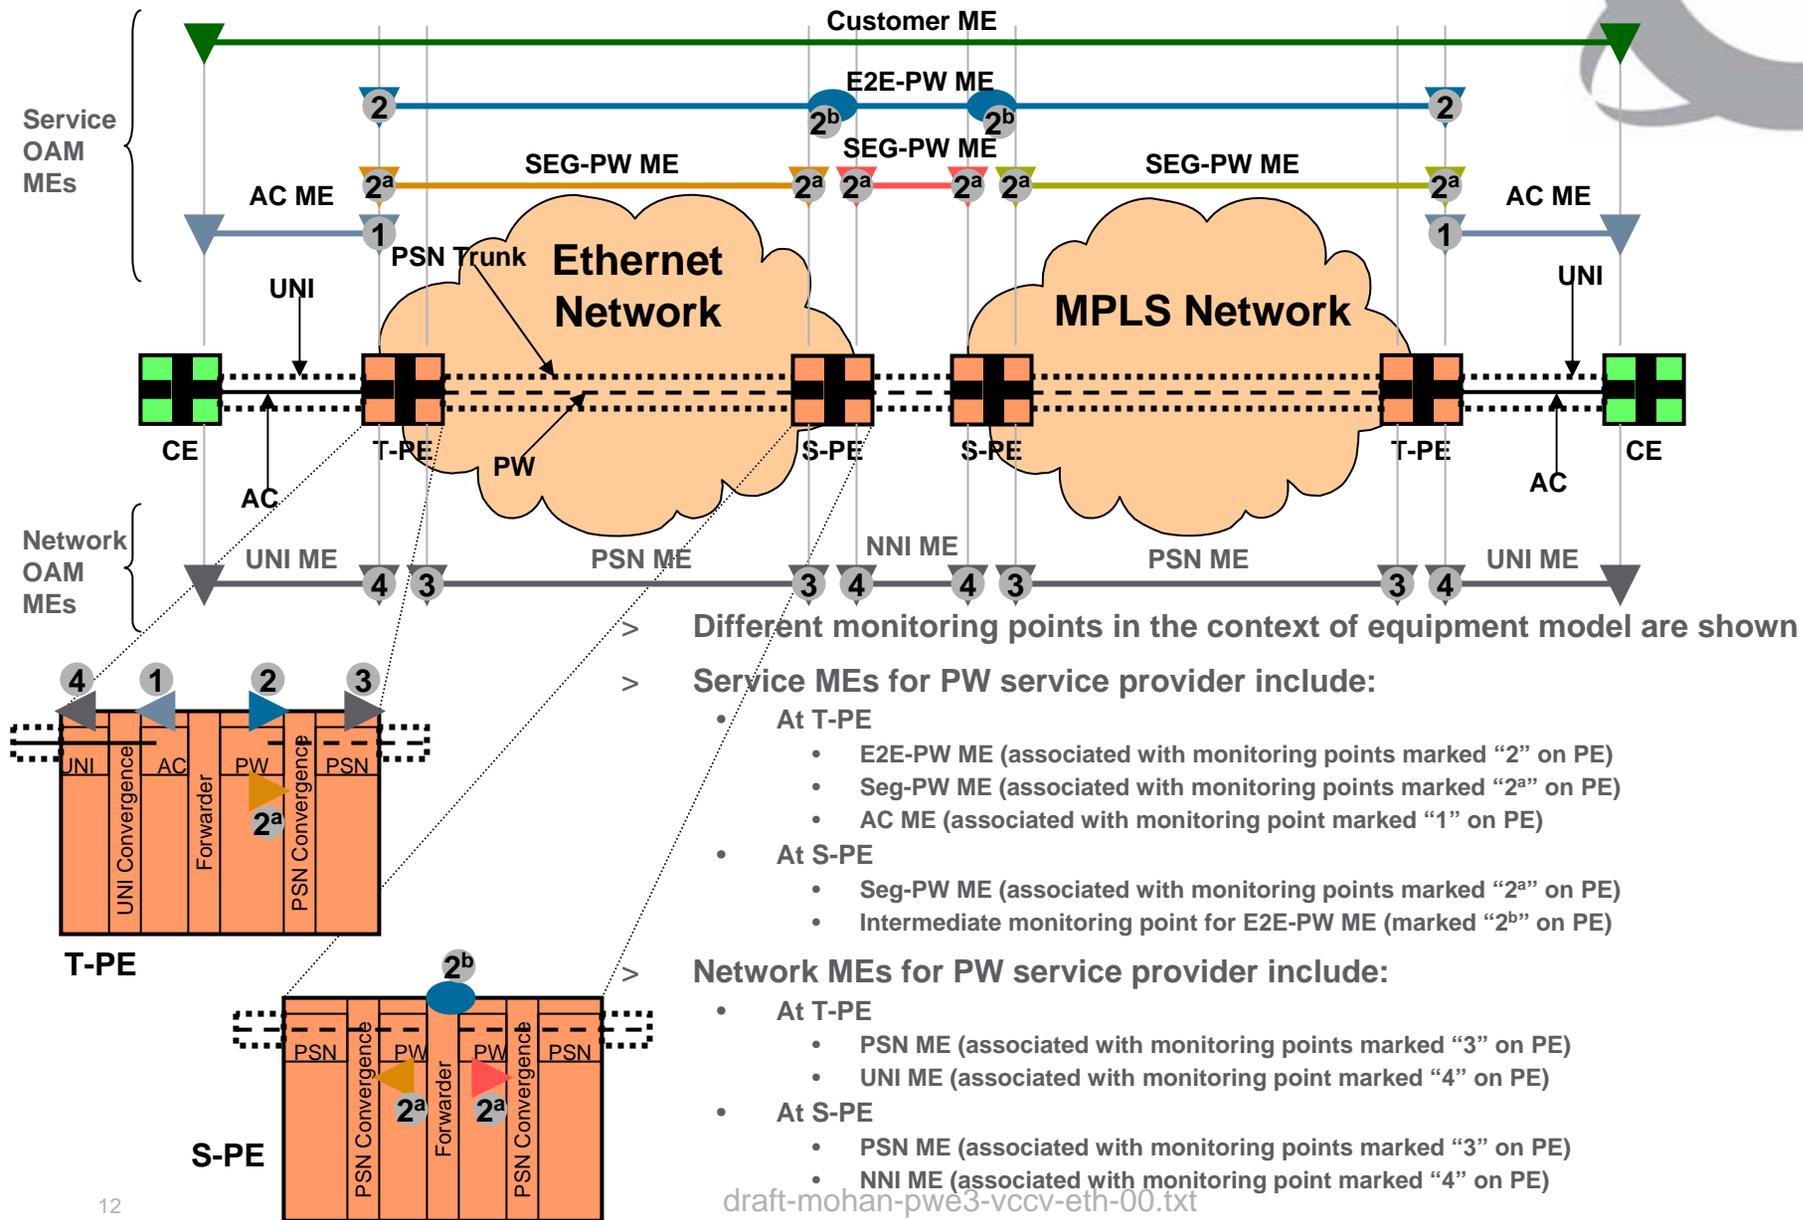

Ethernet OAM & LSP Ping/BFD Comparison

OAM Functionality	Ethernet OAM	LSP Ping	BFD
Fault Detection	CCM	Echo Request with reply mode=1	Asynchronous mode (with Demand bit clear)
Fault Verification (ping)	LBM/LBR	Echo Request/Reply	Demand Mode (via Poll and Final bits)
Fault Localization/Link Trace (Traceroute)	LTM/LTR	Note ¹	Note ¹
Fault Notification	AIS and BFD	-	Via "Diagnostic code" in BFD
Discovery	mLBM/LBR, CCM	-	-
Performance Monitoring – Loss Measurement	CCM, LMM/LMR	-	-
Performance Monitoring – Delay Measurement	1DM, DMM/DMR	-	-
Protection Switching	APS	-	-
Remote Management	MCC	-	-
Diagnostics (data plane)	TST, LBM/LBR	-	-

> Note¹

- In SS-PW, there is single PW hop thus Link Trace is not applicable
- In MS-PW, Link Trace is not supported
 - Can be applied using TTL approach and executing multiple echo request/reply
 - With Ethernet OAM PDU, MEG Levels can be used to realize Link Trace in MS-PW

PWE3 MS-PW OAM Approach
