Still at Version -01

- `draft-ietf-mboned-mcast-arpa-01.txt`
- Aiming at **BCP** as an Update to RFC 3171
- No new draft since last IETF
- extensive feedback received from early IANA review (Thanks to Michelle and Leo!)
 - ARPA subdomain formalities
 - wording suggestions
 - v6 multicast reverse needs to be more specific
- -02 expected to be ready for WGLC

Open Issues

- v6 Reverse Mapping dependent on Multicast Groups to be covered
 - PTRs are going to be unique here (one name per group)
- Which v6 Groups to deal with?
 - Scoping is more involved
 - *Fixed-Scope vs. All Scope?*
 - Support *Node-Local, Link-Local, and Site-Local?*
 - Name to Address mapping to contain multiple groups (AAAA) per name?

Thank You!
