ALM API for Topology Management and Network Layer Transparent Multimedia Transport

<draft-lim-irtf-sam-alm-api-00.txt>
71ST IETF SAM-RG MEETING, PHILADELPHIA.

Lim Boon Ping
Ettikan K.K
requirement

• Lack of common set of wrapper API leads to redundant application layer development, thus diluting effort for underlying ALM protocol enhancement and integration on a common application platform.

• Core functions of ALM topology management
  – ALM topology construction (at initial stage),
  – ALM topology re-construction (upon membership change),
  – ALM topology refinement (upon network condition or performance metrics change),
  – ALM topology distribution (for centralized approach),
  – ALM forwarding table lookup (upon data delivery/relay), and
  – Content distribution based on ALM topology.
Goal

• SAMRG
  – Group Management
  – Traffic Management

• Proposal
  – Wrapper API for Topology management
  – Wrapper API for Traffic Management (flexible protocols selection)
Middleware Architecture

SAM Application
(Media streaming, file transfer, video/audio conferencing etc.)

SAMTK Core Module (Middleware)

Topology Management Module
Group Management Module
Traffic Management Module

ALMI / Narada / Yoid / NICE / Bayeux etc.

OS (Linux, Windows etc)
Needs for ALM Topology Management Wrapper API

- **Limitation of Protocol-specific API**
  - ALM protocols export different set of protocol-specific APIs despite providing common services.
  - ALM middleware is restricted to access only one ALM protocol by interfacing with protocol-specific APIs.
  - ALM middleware loses the flexibility to leverage on or access different ALM protocols based on the application needs within the same architecture.
Needs for ALM Topology Management Wrapper API

- **Lack of complete coverage of different ALM APIs**
  - Centralized (eg. ALMI etc.) vs. distributed topology (eg. narada, yoid, bayeux etc.).
  - Overlay-based common API
    - RelayCast - *MakeTree*, *Find*, *SendDat*, *RecvDat*
    - Dabek et al. - *forward*, *join*, *leave*, *local_lookup*, *multicast* and *anycast*
  - Client-server centralized-based common API?
    - ALM server
      - Initialization for receiving membership information, metrics information...
      - construct/update/distribute topology (a.k.a forwarding table)
    - ALM client
      - Receive/update forwarding table from ALM server,
      - perform forwarding table lookup to identify next destination ALM node for content relay.
Usecase Example
Middleware API usage for ALM Tree Construction Approach
Usecase Example
Middleware API usage for ALM Content Distribution / Relay
Backup
Needs For Network Layer Transparent Wrapper API

- **Lack of multimedia network/transport layer selection**
  - ALM protocols define different set of API for content distribution. Neither provides complete selection of IP protocol (v4, v6), transport protocol (tcp/udp/rtp) or multicasting type (IP multicast, multi-unicast, xcast) specifically from the ALM middleware.
  - Flexibility to select the network and transport layer protocols, and the underlying Traffic Management module to switch *dynamically* based on network capability and application need.
Middleware API For Forwarding Path Construction & Distribution

- **constructPath**(const int actionMode, struct AlmPathLst* almPaths, struct AlmMetricsLst* almMetrics)
  - actionMode – BUILDTREE, JOIN
  - almPaths – (output) forwarding table / selected parent path information
  - almMetrics – (optional input) provides metrics information for path construction from external metrics collection/providing module.

- **releasePath**(const int actionMode)

- **sendPath**(const int transportMode, const in sendMode, struct AlmPathLst* almPaths)
  - transportMode – mode of sending table: IPV4, IPV6, AUTO etc.
  - sendMode – NODESPECIFIED, FULL

- **updatePath**(struct AlmPathLst* almPaths)
Middleware API for Content Transmission / Receiving / Relay / Path Lookup

- **send** (const int transportMode, struct AlmData* data)
  - transportMode – ALMCASTV4UDP, ALMCASTV4TCP, ALMCASTV6UDP, ALMCASTV6TCP, IPMULTICAST, AUTO, variant of XCAST6 implementation etc.

- **recv** (struct AlmData* data)

- **relay** (const int transportMode, struct AlmData* data)

- **lookupPath** (uint32_t key, struct AlmDistLst* almDist)
  - Key – primary key to lookup
  - almDist – list of next destination receivers
Objective

- To understand & identify common requirement for SAM framework development & API definition, covering aspects of
  - Topology management (Multi algorithm support)
    - Application Layer Multicast
    - Overlay Multicast
  - Traffic management (Multiple protocol support)
    - Native multicast
    - Xcast
    - Proprietary unicast (eg. ALMcast)
    - etc.
  - Group membership management
## Comparison of SAMTK / ALM API / SAM Overlay Protocol

<table>
<thead>
<tr>
<th>Description</th>
<th>SAMTK</th>
<th>ALM API</th>
<th>SAM Overlay Protocol</th>
</tr>
</thead>
<tbody>
<tr>
<td>Goal</td>
<td>Define the <strong>group management and traffic management API</strong> with topology management module is anticipated to be managed by ALM/OM plugin developer.</td>
<td>Define the <strong>topology management</strong> and <strong>network layer transparent middleware wrapper API</strong> for ALM forwarding table construction, distribution and multimedia transport over IPv4/IPv6 for unicast and xcast.</td>
<td>Define the <strong>overlay API</strong> and messaging needed to • support the multicast tree operations between ALM/NM region via AMT-GW. (Propose P2PP message for SAM to ensure SAM framework to be compatible with P2P SIP). • ensure overlay agnostic API so that different overlay algorithms can interoperate in a single SAM (Scalable Adaptive Multicast) session.</td>
</tr>
<tr>
<td>API consideration for Transport protocol</td>
<td>Define SAMSocken with underlined protocol can be called through standard plugin interface (xcast, multicast, ipv6, alm)</td>
<td>Transport layer transparent via selection of underlying transport protocol. May work as another higher level API on top of SAMTK standard plugin interface. (necessary?)</td>
<td>Generic multicast message. Note: Use AMT (Automatic IP Multicast Without Explicit Tunnels) to connect peers in ALM (Application Layer Multicast) regions with peers in native multicast regions.</td>
</tr>
<tr>
<td>API consideration for Topology Management</td>
<td>Centralized/distributed non-overlay-based ALM.</td>
<td></td>
<td>Overlay multicast</td>
</tr>
<tr>
<td>API consideration for Group Management</td>
<td>Define list of group management related API</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Comparison of SAMTK / ALM API / SAM Overlay Protocol

- SAM Application (Media streaming, file transfer, video/audio conferencing etc.)
- Middleware (Application Controller)
- Standard Interface
- Topology Management Module
- Traffic Management Module
- Overlay Multipath
- OS (Linux, Windows etc.)
- Overlay Multicast
- Centralized / distributed based ALM/OM
- Transparent Transport Layer Selection
- SAMTK
- SAM AM?
- Apps Layer
- Overlay / Transport Protocol
- Multicast
- ALM/OM

# DMMP vs. SAM Overlay Protocol

<table>
<thead>
<tr>
<th>Description</th>
<th>DMMP</th>
<th>SAM Overlay Protocol</th>
</tr>
</thead>
</table>
| **Goal**        | A new dynamic mesh-based OM protocol framework, with protocol details for data and control plane:  
• Session initialization &  
• Super node selection  
• Member join/leave  
• Refresh (heartbeat) information  
• Data delivery control  
• Failure recovery  
• Self-improvement (optimization) | Define the **overlay API** and messaging needed to  
• support the multicast tree operations between ALM/NM region via AMT-GW. (Propose P2PP message for SAM to ensure SAM framework to be compatible with P2P SIP).  
• ensure overlay agnostic API so that different overlay algorithms can interoperate in a single SAM (Scalable Adaptive Multicast) session. |
| **Member join/leave** | Member join/leave in dynamic OM-based cluster (super node-based cluster). | Member join/leave in ALM with additional consideration to NM region over AMT-GW. |
| **Node selection** | Details of super node selection, optimization (via node promotion), number of node per cluster/level are discussed. | No specific discussion on node selection. |
| **Keep alive information** | Refresh message is sent to peer periodically. If peer does not receive refresh message on time, it shall send PROBE message before notifying others. | Heartbeat message is sent to peer periodically. No probe is further sent |
