

IPsec ESP Extensions for Traffic Visibility

Ken Grewal

Gabriel Montenegro

Problem Description

- Scope: Traffic visibility for ESP traffic only
 - Very important in enterprise deployments
 - AH can be used, but not NAT friendly (And yes, there are NATs inside enterprise environments)
- IPsec is predominantly used for remote access / VPNs
 - Transport mode IPsec still needs good standard support
- Enterprise environments require not only security, but also traffic visibility
 - Firewalls and Traffic-shaping tools
 - Network monitoring tools
 - Deep packet inspection and scanning (for worms/viruses)
 - Intrusion Detection & Prevention Systems (IDS/IPS)
- Current IPsec specs do not allow deterministic differentiation between ESP-NULL and ESP-encrypted traffic

Proposed Solution

- New protocol ‘wrapper’ for existing ESP packet format
- Wrapper defines the packet encapsulation
- Stateless, efficient parsing of ESP-NULL packets using data within the packet
- Enables E2E security with traffic visibility

Alternative Proposals

2 proposals submitted:

- draft-hoffman-esp-null-protocol-00.txt
 - Paul Hoffman & David McGrew
 - Expired?
- draft-grewal-ipsec-traffic-visibility-01.txt
 - Ken Grewal & Gabriel Montenegro

draft-hoffman-esp-null-protocol

- 2 new protocols for identifying ESP-NUL
 - **ESP-AUTH-ONLY-NO-IV**
 - **ESP-AUTH-ONLY-8-OCTET-IV**
- IKE Dependencies
 - New transforms with new protocol numbers
 - If recognized, use it (based on policy), else fall back to protocol 50 (ESP)

draft-grewal-ipsec-traffic-visibility

- 1 new protocol for identifying “Extended ESP”
- UDP encapsulation compatibility for NAT-T
- IKE Dependencies
 - New transform with new protocol number
 - If recognized, use it (based on policy), else fall back to protocol 50 (ESP)

ESP Extensions

+-----+-----+-----+-----+-----+-----+-----+-----+	+-----+-----+-----+-----+-----+-----+-----+-----+	+-----+-----+-----+-----+-----+-----+-----+-----+	+-----+-----+-----+-----+-----+-----+-----+-----+
Padding (0-255 bytes) PAD Length Next Header			
+-----+-----+-----+-----+-----+-----+-----+-----+	+-----+-----+-----+-----+-----+-----+-----+-----+	+-----+-----+-----+-----+-----+-----+-----+-----+	+-----+-----+-----+-----+-----+-----+-----+-----+
Integrity Check Value-ICV (variable)			
~			~
+-----+-----+-----+-----+-----+-----+-----+-----+	+-----+-----+-----+-----+-----+-----+-----+-----+	+-----+-----+-----+-----+-----+-----+-----+-----+	+-----+-----+-----+-----+-----+-----+-----+-----+

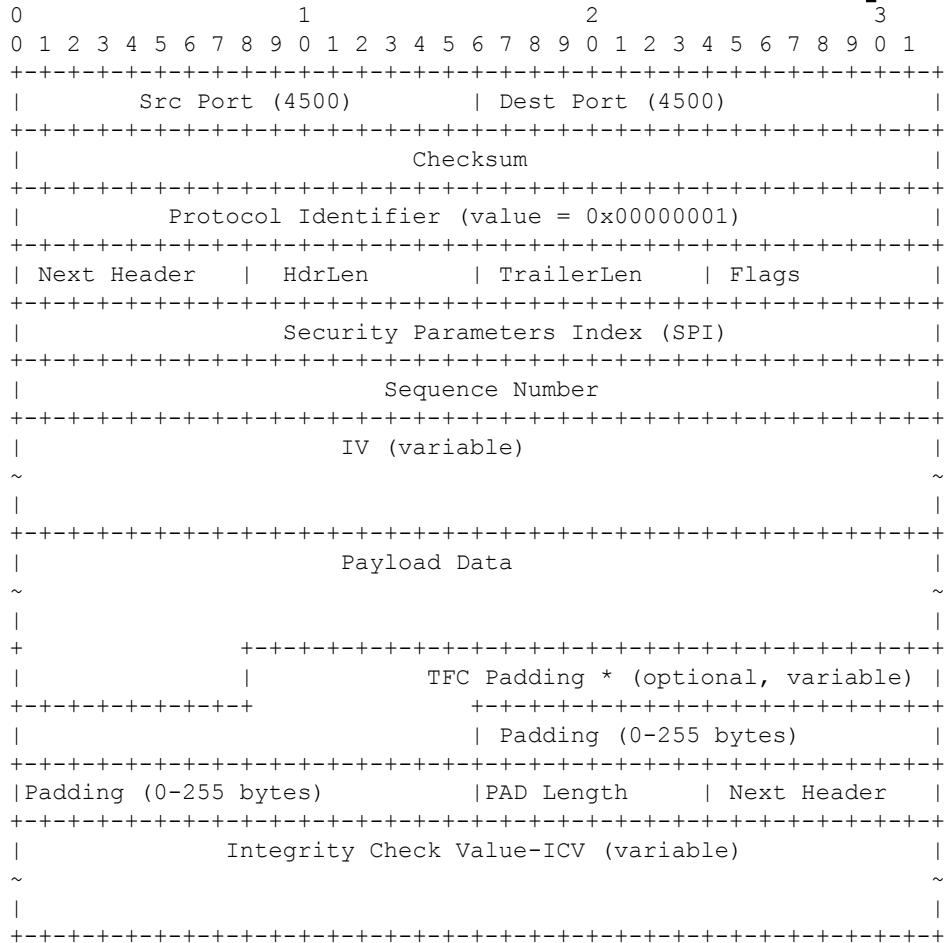

Where:

- **Next Header:** Next protocol
- **HdrLen:** offset in octets to start of payload
- **TrailerLen:** Offset from end of packet to end of payload

• Flags:

- 2 bits Version
- 1 bit Integrity Only
- 5 bits reserved

UDP-Encapsulation

Where:

- Protocol Identifier: Fixed value
 - e.g. 0x01
- Differentiate between IKE/ESP/XESP packets
- Preserves UDP 4500 for NATs
- All other fields as in previous slide

Compatible with and preserves NAT-T encapsulation

Summary

- XESP critical to Enterprise based IPsec deployments
- Applicable to XESP only (does not impact AH or ESP)
- XESP ‘wrapper’ concept is similar to NAT-T
 - Extends ESP, instead of breaking it
 - Aids Transport-mode IPsec deployment in Enterprises
