Generic Notification Message for Mobile IPv4

Hui. Deng [denghui@chinamobile.com]
Henrik Levkowetz
Vijay Devarapalli
Sri Gundavelli
Brian Haley
Update since last meeting

- Replay protection
- Code indicating the result of GNM message
- Removed binding revocation support
Replay protection

- A specific section for it.

- Sender-Receiver AE is mandatory, like MN-HA AE, MN-FA AE, FA-HA AE.

- Timestamps based
  - Valid: copy the entire identification field into GNAM
  - Invalid: low-order 32 bits and error code number

- More text in each section about detail handling of the replay protection and identification field.
Code indicating the result of GNM message

- Could be used for time-resynchronization.
- Indicate authentication failure.
- Indicate identification mismatch.
- Others: reason unspecified, insufficient resources, administratively prohibited.
Removed binding revocation support

• The reason is that binding revocation is not only handled by an option which could be used directly by notification message.
• More comments?
