

RTSP 2.0

draft-ietf-mmusic-rfc2326bis-22

Status Update

- Rolled two version since last IETF meeting
- Language improvements thanks to Torbjörn Einarsson and Jaehwan Kim
- Renamed the misspelled Referer header to Referrer
- Clarified behavior when PLAY requesting range beyond available end-point.
- Defined behavior when updating PLAY request to include stop point that is already passed by server.
- Clarified behavior when including RTP-Info and Range in GET_PARAMETER requests

Status Update, continued

- Changed the syntax for float values from
 - ["-"] 1*39DIGIT [". " 1*46DIGIT]
 - ["-"] 1*12DIGIT [". " 1*9DIGIT]
 - As it appears that the number of digits was way beyond what is needed for RTSP
- Added missing PLAY-NOTIFY in an example

Next Steps

- Thanks to the ones that has commented
- We have only a single issue open
 - The Changes section needs update
- We now need more reviews to find any remaining issues
- People have been reluctant to review as it doesn't appear ready
- Propose that we start a 4 week WG last call
 - 4 weeks because it is a big document to read
