

Cryptographic Algorithm Identifier Allocation for DNSSEC

Hiroshima, November 2009

Paul Hoffman, VPN Consortium

Document status

- Published draft-ietf-dnsext-dnssec-alg-allocation-00 in September
- Essentially no discussion since

What it does (Section 2)

- Changes DNS Security Algorithm Numbers Registry from “standard required” to “RFC required”
- Adds current standards level to the registry
- Suggests that this change be reevaluated after about 120 more registrations

What it does not do (Section 3)

- Explicitly does not change any requirements to implement
- Explicitly does not suggest that developers implement all registered algorithms just because there is an RFC describing the algorithm

Next steps

- More discussion or WG LC on the -00
