

IETF 76 ISMS WG

RADIUS Enabled VACM

**David B. Nelson
November 10, 2009**

RADIUS Enabled VACM

- Draft status
 - Revision -01 in preparation
 - Missed the cutoff prior to IETF 76
 - Added an **Elements of Procedure** section
 - Added a **MIB Module** section
 - Seeking additional author /editor assistance

RADIUS Enabled VACM

- Issues that need further definition
 - Is this document:
 - (a) An amendment or extension to VACM?
 - (b) A standalone document that describes remote provisioning of the securityName to Group mapping table?
 - (c) A new Access Control Model?
 - Current thinking is that it's (b).

RADIUS Enabled VACM

- Issues that need further definition:
 - Should the new MIB Module be rooted in an new IANA-assigned OID?
 - Should the new columns defined in the MIB Module be in the same table as defined in the current VACM MIB Module?
 - Or should there be a separate table that happens (conveniently) to share the same index objects?

RADIUS Enabled VACM

- Issues that need further definition:
 - Do the Elements of Procedure in this document in any way reference or update the EOP of VACM?
 - Or do the EOP in this document only describe dynamic row creation and deletion, together with any attendant error conditions?
- The current thinking is that it's the latter.

RADIUS Enabled VACM

- Next steps:
 - Solicit and receive some editing assistance and consultation on the EOP and MIB Module sections
 - Complete and submit the -01 revision (or alternatively the -00 WG work item draft)
 - Solicit review and comments from the WG at large
