Exporting MIB variables using the IPFIX Protocol

draft-johnson-ipfix-mib-variable-export-00.txt
A. Johnson, P. Aitken, B. Claise
Exporting MIB variables using the IPFIX Protocol

• Abstract
  This document specifies a way to export Management Information Base (MIB) objects within the IPFIX protocol, avoiding the need to define new IPFIX Information Elements for existing Management Information Base objects that are already fully specified. This method requires an extension to the current IPFIX protocol. New Template Set and Options Template Sets are specified to allow the export of Simple Network Management Protocol (SNMP) MIB Objects.

• Focus on the big picture for OPS-AREA
• More IPFIX technical details in the IPFIX session
Exporting MIB variables using the IPFIX Protocol Why?

- Foresee the need to export existing MIB fields
  Requested by some collector partners, and every proxy costs some money…

- No synchronized counters between Flow and MIB counters
  Potential flow expiration timeout
  Then Flow Record exported
  Then SNMPGet
  Then SNMPGet Response
  => Flow and Counters not synchronized
  Example: interface or QoS counters at the time the flow expired
Exporting MIB variables using the IPFIX Protocol

Why?

• Data model replication: two data models for a unique information model (*) , i.e. MIB and IPFIX information elements, which are overlapping.
  – For example, ingressInterface I.E. “The index of the IP interface where packets of this Flow are being received. The value matches the value of managed object 'ifIndex' as defined in RFC 2863.”
  – For example, interfaceName I.E. “See [RFC2863] for the definition of the ifName object.”
  – More in the future…

(*) RFC 3444, "On the Difference between Information Models and Data Models"
Exporting MIB variables using the IPFIX Protocol Scope

• This mechanism applies to:
  – the addition of MIB variables to IPFIX Information Element in Flow Records

• This mechanism doesn’t apply to:
  – Configuration, as IPFIX is a PUSH mechanism
  – Though some config MIB objects could be exported

• This mechanism could be applied to:
  – Replacement of SNMP notification, though this is not the initial goal. There is already the EVENT & EXPRESSION MIBs mechanism to create customized SNMP notifications
Exporting MIB variables using the IPFIX Protocol
MIB Object Access?

- The IPFIX Metering Process is configured to access some MIB objects, but can these objects be monitored?
  - The Metering Process (*) MUST check whether or not the MIB variables can be accessed, and hence exported with IPFIX.
  - Therefore a read or read-write community string in SNMPv1 and SNMPv2c, or a principal in SNMPv3, MUST be associated with the Metering Process.
  - If the management entity supports the View-based Access Control Model (VACM) for the SNMP [RFC3415], then the Metering Process MUST validate with the View-Based Access Control [RFC3415] that the MIB object can be accessed before exporting his content.
  - If there is a view in case of SNMPv1 and SNMPv2c, the Metering Process MUST validate that the MIB object can be accessed before exporting his content.

(*) or the configuration process, to be discussed
Exporting MIB variables using the IPFIX Protocol

Example 1: Non-index OID export

- Example: CPU utilization percentage sent every 1 minute

<table>
<thead>
<tr>
<th>TIMESTAMP</th>
<th>CPU BUSY PERCENTAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>StartTime + 0 seconds</td>
<td>10%</td>
</tr>
<tr>
<td>StartTime + 60 seconds</td>
<td>14%</td>
</tr>
<tr>
<td>StartTime + 120 seconds</td>
<td>19%</td>
</tr>
<tr>
<td>StartTime + 180 seconds</td>
<td>16%</td>
</tr>
</tbody>
</table>

- Template Record:
  - flowStartSeconds (IPFIX IE)
  - cpmCPUTotal1minRev (MIB OID)
Exporting MIB variables using the IPFIX Protocol
Example 2: Indexed OID Export

• Example: export the queue counters with the flow record
• Template Record:
  – sourceIPv4Address (IPFIX IE)
  – destinationIPv4Address (IPFIX IE)
  – totalLengthIPv4 (IPFIX IE)
  – egressInterface (IPFIX IE)
  – outboundQueueLength (MIB OID)
    indexed by: egressInterface (IPFIX IE)

This spec. also foresees the case where this index is a MIB OID
Exporting MIB variables using the IPFIX Protocol
Example 2: Indexed OID Export

New spec implies a new Set ID

One index

This is the index. In this case, an IPFIX IE

This is the new IPFIX spec.
Exporting MIB variables using the IPFIX Protocol

IPFIX Implications

• Requires an extension to the current IPFIX Protocol:
  – New (Options) Template Sets

• Targeting Standard Track
  – Patent-7788371
  – IPR: https://datatracker.ietf.org/ipr/1436/
  – Would like to get a broad technology review
TO DO

• Better explain the draft concept
• Add some more examples
• Juergen Schoenwalder’s feedback
• Validate the security section
