Application-Layer Traffic Optimization (ALTO) Requirements
draft-ietf-alto-reqs-08.txt

Abstract

Many Internet applications are used to access resources, such as pieces of information or server processes, which are available in several equivalent replicas on different hosts. This includes, but is not limited to, peer-to-peer file sharing applications. The goal of Application-Layer Traffic Optimization (ALTO) is to provide guidance to applications, which have to select one or several hosts from a set of candidates, that are able to provide a desired resource. This guidance shall be based on parameters that affect performance and efficiency of the data transmission between the hosts, e.g., the topological distance. The ultimate goal is to improve performance (or Quality of Experience) in the application while reducing resource consumption in the underlying network infrastructure.

This document enumerates requirements for ALTO, which should be considered when specifying, assessing, or comparing protocols and implementations.

Status of this Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any

time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on September 15, 2011.

1. Introduction

The motivation for Application-Layer Traffic Optimization (ALTO) is described in the ALTO problem statement [RFC5693].

The goal of ALTO is to provide information which can help peer-to-peer (P2P) applications to make better decisions with respect to peer selection. However, ALTO may be useful for non-P2P applications as well. For example, clients of client-server applications may use information provided by ALTO to select one of several servers or information replicas. As another example, ALTO information could be used to select a media relay needed for NAT traversal. The goal of these informed decisions is to improve performance (or Quality of Experience) in the application while reducing resource consumption in the underlying network infrastructure.

Usually, it would be difficult or even impossible for application entities to acquire this information by other mechanisms (e.g., using measurements between the peers of a P2P overlay), because of complexity or because it is based on network topology information, network operational costs, or network policies, which the respective network provider does not want to disclose in detail.

The logical entities that provide the ALTO service do not take part in the actual user data transport, i.e., they do not implement functions for relaying user data. They may be placed on various kinds of physical nodes, e.g., on dedicated servers, as auxiliary processes in routers, on "trackers" or "super peers" of a P2P application, etc.

2. Terminology and Architectural Framework

2.1. Requirements Notation

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

2.2. ALTO Terminology

This document uses the following ALTO-related terms, which are defined in [RFC5693]:

Application, Peer, P2P, Resource, Resource Identifier, Resource Provider, Resource Consumer, Transport Address, Overlay Network, Resource Directory, ALTO Service, ALTO Server, ALTO Client, ALTO Query, ALTO Response, ALTO Transaction, Local Traffic, Peering Traffic, Transit Traffic, Application protocol, ALTO Client Protocol, Provisioning protocol.

Furthermore, the following additional terms will be used:

- o Host Group Descriptor: Information used to describe the resource consumer which seeks ALTO guidance, or one or several candidate resource providers. This can be, for example, a single IP address, an address prefix or address range that contains the host(s), or an autonomous system (AS) number. Different options may provide different levels of detail. Depending on the system architecture, this may have implications on the quality of the guidance ALTO is able to provide, on whether recommendations can be aggregated, and on how much privacy-sensitive information about users might be disclosed to additional parties.
- o Host Characteristics Attribute: Properties of a host (other than the host group descriptor), in particular related to its attachment to the network. This information may be stored in the ALTO server and transmitted in the ALTO protocol. It may be evaluated according to the rating criteria.
- o Rating Criterion: The condition or relation that defines the "better" in "better-than-random peer selection", which is the ultimate goal of ALTO. Examples may include "host's Internet access is not subject to volume based charging (flat rate)" or "low topological distance". Some rating criteria, such as "low topological distance", need to include a reference point, i. e., "low topological distance from a given resource consumer", which can be described by means of a host group descriptor.

2.3. Architectural Framework for ALTO

There are various architectural options for how ALTO could be implemented, and specifying or mandating one specific architecture is out of the scope of this document.

The ALTO Working Group Charter [ALTO-charter] itemizes several key components, which shall be elaborated and specified by the ALTO Working Group. The ALTO problem statement [RFC5693] defines a terminology (see Section 2.2) and presents a figure that gives a high-level overview of protocol interaction between ALTO elements.

This document itemizes requirements for the following components and information elements that are part of the above-mentioned architecture:

- o The ALTO client protocol, which is used for sending ALTO queries and ALTO responses between ALTO client and ALTO server.
- o The discovery mechanism, which will be used by ALTO clients in order to find out where to send ALTO requests.
- o The overall architecture, especially with respect to security and privacy issues.
- o Host group descriptors, which are used to describe the location of a host in the network topology.
- o Rating criteria, i. e., conditions or relations that shall be evaluated in order to generate the ALTO guidance.

3. ALTO Requirements

3.1. ALTO Client Protocol

3.1.1. General Requirements

REQ. ARv08-1: The ALTO service is provided by one or more ALTO servers. ALTO servers MUST implement the ALTO client protocol, for receiving ALTO queries from ALTO clients and for sending the corresponding ALTO responses.

REQ. ARv08-2: ALTO clients MUST implement the ALTO client protocol, for sending ALTO queries to ALTO servers and for receiving the corresponding ALTO responses.

REQ. ARv08-3: The format of the ALTO query message MUST allow the ALTO client to solicit guidance for selecting appropriate resource providers.

REQ. ARv08-4: The format of the ALTO response message MUST allow the ALTO server to express its guidance for selecting appropriate resource providers.

REQ. ARv08-5: The detailed specification of a protocol is out of the scope of this document. However, any protocol specification that claims to implement the ALTO client protocol MUST be compliant to the requirements itemized in this document.

3.1.2. Host Group Descriptor Support

The ALTO guidance is based on the evaluation of several resource providers or groups of resource providers, which are characterized by means of host group descriptors, considering one or more rating criteria.

REQ. ARv08-6: The ALTO client protocol MUST support the usage of several different host group descriptor types.

REQ. ARv08-7: The ALTO client protocol specification MUST define a basic set of host group descriptor types, which MUST be supported by all implementations of the ALTO client protocol.

REQ. ARv08-8: The ALTO client protocol MUST support the host group descriptor types "IPv4 address prefix" and "IPv6 address prefix". They can be used to specify the IP address of one host, or an IP address range (in CIDR notation), which contains all hosts in question. It is also possible to specify a broader address range (i.e., a shorter prefix length) than the intended group of hosts

actually uses, in order to conceal their exact identity.

REQ. ARv08-9: The ALTO client protocol specification MUST define an appropriate procedure for adding new host group descriptor types, e.g., by establishing an IANA registry.

REQ. ARv08-10: ALTO clients and ALTO servers MUST clearly identify the type of each host group descriptor sent in ALTO queries or responses.

REQ. ARv08-11: For host group descriptor types other than "IPv4 address prefix" and "IPv6 address prefix", the host group descriptor type identification MUST be supplemented by a reference to a facility, which can be used to translate host group descriptors of that type to IPv4/IPv6 address prefixes, e.g., by means of a mapping table or an algorithm.

REQ. ARv08-12: Protocol functions for mapping other host group descriptor types to IPv4/IPv6 address prefixes SHOULD be designed and specified as part of the ALTO client protocol, and the corresponding address mapping information SHOULD be made available by the same entity that wants to use these host group descriptors within the ALTO client protocol. However, an ALTO server or an ALTO client MAY also send a reference to an external mapping facility, e.g., a translation table to be downloaded as file via HTTP.

REQ. ARv08-13: The ALTO client protocol specification MUST define mechanisms, which can be used by the ALTO server to indicate that a host group descriptor used by the ALTO client is of an unsupported type, or that the indicated mapping mechanism could not be used.

REQ. ARv08-14: The ALTO client protocol specification MUST define mechanisms, which can be used by the ALTO client to indicate that a host group descriptor used by the ALTO server is of an unsupported type, or that the indicated mapping mechanism could not be used.

3.1.3. Rating Criteria Support

REQ. ARv08-15: The ALTO client protocol MUST support the usage of several different rating criteria types.

REQ. ARv08-16: The ALTO client protocol specification MUST define a basic set of rating criteria types, which MUST be supported by all implementations of the ALTO client protocol.

REQ. ARv08-17: The ALTO client protocol specification MUST define a rating criterion that can be used to express and evaluate the "relative operator's preference." This is a relative measure, i.e.,

it is not associated with any unit of measurement. A more-preferred rating according to this criterion indicates that the application should prefer the respective candidate resource provider over others with less-preferred ratings (unless information from non-ALTO sources suggests a different choice, such as transmission attempts suggesting that the path is currently congested). The operator of the ALTO server does not have to disclose how and based on which data the ratings are actually computed. Examples could be: cost for peering or transit traffic, traffic engineering inside the network, and other policies.

REQ. ARv08-18: The ALTO client protocol specification MUST define an appropriate procedure for adding new rating criteria types, e.g., by establishing an IANA registry.

REQ. ARv08-19: ALTO client protocol specifications MUST NOT define rating criteria closely related to the instantaneous network congestion state, whose primary aim is to serve an alternative to established congestion control strategies, such as using TCP-based transport.

One design assumption for ALTO is that it is acceptable that the host characteristics attributes, which are stored and processed in the ALTO servers for giving the guidance, are updated rather infrequently. Typical update intervals may be several orders of magnitude longer than the typical network-layer packet round-trip time (RTT). Therefore, ALTO cannot be a replacement for TCP-like congestion control mechanisms. The definition of alternate approaches for congestion control is explicitly a non-goal for the ALTO working group [ALTO-charter].

REQ. ARv08-20: Applications using ALTO guidance MUST NOT rely on the ALTO guidance to avoid network congestion. Instead, applications MUST use other appropriate means, such as TCP based transport, to avoid causing excessive congestion.

REQ. ARv08-21: The ALTO query message SHOULD allow the ALTO client to express which rating criteria should be considered, as well as their relative relevance for the specific application that will eventually make use of the guidance.

REQ. ARv08-22: The ALTO response message SHOULD allow the ALTO server to express which rating criteria have been considered when generating the response.

REQ. ARv08-23: The ALTO client protocol specification MUST define mechanisms, which can be used by the ALTO client and the ALTO server to indicate that a rating criteria used by the other party is of an

unsupported type.

3.1.4. Placement of Entities and Timing of Transactions

With respect to the placement of ALTO clients, several modes of operation exist:

- o One mode of ALTO operation is that an ALTO client may be embedded directly in the resource consumer, i.e., the application protocol entity that will eventually initiate data transmission to/from the selected resource provider(s) in order to access the desired resource. For example, an ALTO client could be integrated into the peer of a P2P application that uses a distributed algorithm such as "query flooding" for resource discovery.
- o Another mode of operation is to integrate the ALTO client into a third party such as a resource directory, which may issue ALTO queries to solicit preference on potential resource providers, considering the respective resource consumer. For example, an ALTO client could be integrated into the tracker of a tracker-based P2P application, in order to request ALTO guidance on behalf of the peers contacting the tracker.

REQ. ARv08-24: The ALTO client protocol MUST support the mode of operation in which the ALTO client is directly embedded in the resource consumer.

REQ. ARv08-25: The ALTO client protocol MUST support the mode of operation in which the ALTO client is embedded in a third party, which performs queries on behalf of resource consumers.

REQ. ARv08-26: The ALTO client protocol MUST be designed in a way that the ALTO service can be provided by an entity which is not the operator of the IP access network.

REQ. ARv08-27: The ALTO client protocol MUST be designed in a way that different instances of the ALTO service operated by different providers can coexist.

With respect to the timing of ALTO queries, several modes of operation exist:

- o In target-aware query mode, an ALTO client performs the ALTO query when the desired resource and a set of candidate resource providers are already known, i. e., after DHT lookups, queries to the resource directory, etc.

- o In target-independent query mode, ALTO queries are performed in advance or periodically, in order to receive comprehensive, "target-independent" guidance, which will be cached locally and evaluated later, when a resource is to be accessed.

REQ. ARv08-28: The ALTO client protocol MUST support at least one of these two modes, either the target-aware or the target-independent query mode.

REQ. ARv08-29: The ALTO client protocol SHOULD support both the target-aware and the target-independent query mode.

REQ. ARv08-30: The ALTO client protocol SHOULD support lifetime attributes, to enable caching of recommendations at ALTO clients.

REQ. ARv08-31: The ALTO client protocol SHOULD specify an aging mechanism, which allows to give newer recommendations precedence over older ones.

REQ. ARv08-32: The ALTO client protocol SHOULD allow the ALTO server to add information about appropriate modes of re-use to its ALTO responses. Re-use may include redistributing an ALTO response to other parties, as well as using the same ALTO information in a resource directory to improve the responses to different resource consumers, within the specified lifetime of the ALTO response. The ALTO server SHOULD be able to express that

- o no re-use should occur
- o re-use is appropriate for a specific "target audience", i.e., a set of resource consumers explicitly defined by a list of host group descriptors. The ALTO server MAY specify a "target audience" in the ALTO response, which is only a subset of the known actual "target audience", e.g., if required by operator policies
- o re-use is appropriate for any resource consumer that would send (or cause a third party sending on behalf of it) the same ALTO query (i.e., with the same query parameters, except for the resource consumer ID, if applicable) to this ALTO server
- o re-use is appropriate for any resource consumer that would send (or cause a third party sending on behalf of it) the same ALTO query (i.e., with the same query parameters, except for the resource consumer ID, if applicable) to any other ALTO server, which was discovered (using an ALTO discovery mechanism) together with this ALTO server

- o re-use is appropriate for any resource consumer that would send (or cause a third party sending on behalf of it) the same ALTO query (i.e., with the same query parameters, except for the resource consumer ID, if applicable) to any ALTO server in the whole network

REQ. ARv08-33: The ALTO client protocol MUST support scenarios with the ALTO client located in the private address realm behind a network address translator (NAT). There are different types of NAT, see [RFC4787] and [RFC5382].

3.1.5. Protocol Extensibility

REQ. ARv08-34: The ALTO client protocol MUST include support for adding protocol extensions in a non-disruptive, backward-compatible way.

REQ. ARv08-35: The ALTO client protocol MUST include protocol versioning support, in order to clearly distinguish between incompatible versions of the protocol.

3.1.6. Error Handling and Overload Protection

REQ. ARv08-36: The ALTO client protocol MUST use TCP based transport.

REQ. ARv08-37: An ALTO server, which is operating close to its capacity limit, MUST be able to inform clients about its impending overload situation, and require them to throttle their query rate.

REQ. ARv08-38: An ALTO server, which is operating close to its capacity limit, MUST be able to inform clients about its impending overload situation, and redirect them to another ALTO server.

REQ. ARv08-39: An ALTO server, which is operating close to its capacity limit, MUST be able to inform clients about its impending overload situation, and terminate the conversation with the ALTO client.

REQ. ARv08-40: An ALTO server, which is operating close to its capacity limit, MUST be able to inform clients about its impending overload situation, and reject new conversation attempts.

3.2. ALTO Server Discovery

The ALTO client protocol is supported by one or several ALTO server discovery mechanisms, which may be used by ALTO clients in order to determine one or more ALTO servers to which ALTO requests can be sent

REQ. ARv08-41: ALTO clients which are embedded in the resource consumer MUST be able to use an ALTO server discovery mechanism, in order to find one or several ALTO servers that can provide ALTO guidance suitable for the resource consumer. This mode of operation is called "resource consumer initiated ALTO server discovery".

REQ. ARv08-42: ALTO clients which are embedded in a resource directory and perform third-party ALTO queries on behalf of a remote resource consumer MUST be able to use an ALTO server discovery mechanism, in order to find one or several ALTO servers that can provide ALTO guidance suitable for the respective resource consumer. This mode of operation is called "third-party ALTO server discovery".

REQ. ARv08-43: ALTO clients MUST be able to perform resource consumer initiated ALTO server discovery, even if they are located behind a network address translator (NAT).

REQ. ARv08-44: ALTO clients MUST be able to perform third-party ALTO server discovery, even if they are located behind a network address translator (NAT).

REQ. ARv08-45: ALTO clients MUST be able to perform third-party ALTO server discovery, even if the resource consumer, on behalf of which the ALTO query will be sent, is located behind a network address translator (NAT).

REQ. ARv08-46: ALTO server discovery mechanisms SHOULD leverage an existing protocol or mechanism, such as DNS, DHCP, or PPP based automatic configuration, etc. A single mechanism with a broad spectrum of applicability SHOULD be preferred over several different mechanisms with narrower scopes.

REQ. ARv08-47: Every ALTO server discovery mechanism SHOULD be able to return the respective contact information for multiple ALTO servers.

REQ. ARv08-48: Every ALTO server discovery mechanism SHOULD be able to indicate preferences for each returned ALTO server contact information.

3.3. Security and Privacy

REQ. ARv08-49: The ALTO client protocol MUST support mechanisms for the authentication of ALTO servers.

REQ. ARv08-50: The ALTO client protocol MUST support mechanisms for the authentication of ALTO clients.

REQ. ARv08-51: The ALTO client protocol MUST support mechanisms for the encryption of messages.

REQ. ARv08-52: The ALTO client protocol MUST support different levels of detail in queries and responses, in order for the operator of an ALTO service to be able to control how much information (e.g., about the network topology) is disclosed.

REQ. ARv08-53: The operator of an ALTO server MUST NOT assume that an ALTO client will implement mechanisms or comply with rules that limit the ALTO client's ability to redistribute information retrieved from the ALTO server to third parties.

REQ. ARv08-54: The ALTO client protocol MUST support different levels of detail in queries and responses, in order to protect the privacy of users, to ensure that the operators of ALTO servers and other users of the same application cannot derive sensitive information.

REQ. ARv08-55: The ALTO client protocol SHOULD be defined in a way, that the operator of one ALTO server cannot easily deduce the resource identifier (e.g., file name in P2P file sharing) which the resource consumer seeking ALTO guidance wants to access.

REQ. ARv08-56: The ALTO client protocol MUST support appropriate mechanisms to protect the ALTO service against DoS attacks.

4. IANA Considerations

This requirements document does not mandate any immediate IANA actions. However, such IANA considerations may arise from future ALTO specification documents which try to meet the requirements given here.

5. Security Considerations

5.1. High-level security considerations

High-level security considerations for the ALTO service can be found in the "Security Considerations" section of the ALTO problem statement document [RFC5693].

5.2. Information Disclosure Scenarios

The unwanted disclosure of information is one key concern related to ALTO. This section presents a classification and discussion of information disclosure scenarios and potential countermeasures.

5.2.1. Classification of Information Disclosure Scenarios

- o (1) Excess disclosure of ALTO server operator's data to an authorized ALTO client. The operator of an ALTO server has to feed information, such as tables mapping host group descriptors to host characteristics attributes, into the server, thereby enabling it to give guidance to ALTO clients. Some operators might consider the full set of this information confidential (e.g., a detailed map of the operator's network topology), and might want to disclose only a subset of it or somehow obfuscated information to an ALTO client.
- o (2) Disclosure of the application behavior to the ALTO server. The operator of an ALTO server could infer the application behavior (e.g., content identifiers in P2P file sharing applications, or lists of resource providers that are considered for establishing a connection) from the ALTO queries sent by an ALTO client.
- o (3) Disclosure of ALTO server operator's data (e.g., network topology information) to an unauthorized third party. There are a three sub-cases here:
 - * (3a) An ALTO server sends the information directly to an unauthorized ALTO client.
 - * (3b) An unauthorized party snoops on the data transmission from the ALTO server to an authorized ALTO client.
 - * (3c) An authorized ALTO client knowingly forwards the information it had received from the ALTO server to an unauthorized party.

- o (4) Disclosure of the application behavior to an unauthorized third party.
- o (5) Excess retrieval of ALTO server operator's data by collaborating ALTO clients. Several authorized ALTO clients could ask an ALTO server for guidance, and redistribute the responses among each other (see also case 3c). By correlating the ALTO responses they could find out more information than intended to be disclosed by the ALTO server operator.

5.2.2. Discussion of Information Disclosure Scenarios

Scenario (1) may be addressed by the ALTO server operator choosing the level of detail of the information to be populated into the ALTO server. Furthermore, access control mechanisms for filtering ALTO responses according to the authenticated ALTO client identity might be installed in the ALTO server, although this might not be effective given the lack of efficient mechanisms for addressing (3c) and (5), see below.

(2) can and needs to be addressed in several ways: If the ALTO client is embedded in the resource consumer, the resource consumer's IP address (or the "public" IP address of the outermost NAT in front of the resource consumer) is disclosed to the ALTO server as a matter of principle, because it is in the source address fields of the IP headers. By using a proxy, the disclosure of source addresses to the ALTO server can be avoided at the cost of disclosing them to said proxy. If, in contrast, the ALTO client is embedded in a third party (e.g., a resource directory) which issues ALTO requests on behalf of resource consumers, it is possible to hide the exact addresses of the resource consumers from the ALTO server, e.g., by zeroing-out or randomizing the last few bits of the IP addresses. However, there is the potential side effect of yielding inaccurate results.

The disclosure of candidate resource providers' addresses to the ALTO server can be avoided by allowing ALTO clients to use the target-independent query mode. In this mode of operation, guiding information (e.g., "maps") is retrieved from the ALTO server and used entirely locally by the ALTO client, i.e., without sending host location attributes of candidate resource providers to the ALTO server. In the target-aware query mode, this issue can be addressed by ALTO clients by obfuscating the identity of candidate resource consumers, e.g., by zeroing-out or randomizing the last few bits of the IP addresses. However, there is the potential side effect of yielding inaccurate results.

(3a), (3b), and (4) may be addressed by authentication, access control, and encryption schemes for the ALTO client protocol.

However, deployment of encryption schemes might not be effective given the lack of efficient mechanisms for addressing (3c) and (5), see below.

Straightforward authentication and encryption schemes will not help solving (3c) and (5), and there is no other simple and efficient mechanism known. The cost of complex approaches, e.g., based on digital rights management (DRM), might easily outweigh the benefits of the whole ALTO solution, and therefore they are not considered as a viable solution. That is, ALTO server operators must be aware that (3c) and (5) cannot be prevented from happening, and therefore they should feed only such data into an ALTO server, which they do not consider sensitive with respect to (3c) and (5).

These insights are reflected in the requirements in this document.

5.3. Security Requirements

For a set of specific security requirements please refer to Section 3.3 of this document.
