

## **IPv6 Extension Headers**

draft-ietf-6man-exthdr-02.txt

Suresh Krishnan, Ericsson
James Woodyatt, Apple
Erik Kline, Google
James Hoagland, Symantec
Manav Bhatia, Alcatel-Lucent

#### What happened?

- The draft consisted of three separate but related parts
  - a) A consistent format for extension headers
  - b) A single IP protocol number allocation for saving protocol number space
  - c) A set of bits that specify drop/error behavior
- Since the last IETF it has become clear that there is no consensus to keep b) and c) in the document
  - We have removed b) and c) from the draft

#### What is the preferred mechanism?

- > WG participants also raised concerns that new extension headers
  - -Will break some deployed silicon
  - Are not suitable for incremental deployment
- > Because of this the draft will NOT RECOMMEND using extension headers
  - It will direct implementers to consider using destination options instead

### **Applicability Statement**

- A new applicability statement has been added
- "...implementations **SHOULD** use destination options as the preferred mechanism for encoding optional destination information, and use a new extension header only if destination options do not satisfy their needs. The request for creation of a new IPv6 extension header MUST be accompanied by an specific explanation of why destination options could not be used to convey this information."

#### Way forward

- We have addressed all comments received on the mailing list and minimized the draft to the bare basics
- > What about the stuff we removed?
  - -Does anyone still care about them. Please speak up if you do.
- Otherwise, the authors believe that the document will be ready for WGLC after one minor editorial change
  - John Leslie argued that the term TLV is not relevant in this document. We will agree to a new wording and make this change

| Next Header | Hdr Ext Len |
Header Specific Data
Next Header
                 8-bit selector. Identifies the type of header
                 immediately following the Extension header.
                 Uses the same values as the IPv4 Protocol
                 field.
Hdr Ext Len
                 8-bit unsigned integer. Length of the
                 Extension header in 8-octet units, not
                 including the first 8 octets.
Header Specific
                 Variable length. Fields specific to the
Data
                 extension header
