NFSv4.2

Tom Haynes
NetApp

Consensus on READ_PLUS

- READ_PLUS does
 - Data
 - ADBs
 - Holes
- With pNFS, it just returns what the DS is aware of

Union and ARM support

- Added an error code to differentiate between
 - OP not supported
 - ARM of Union of OP not supported
- Hole for extensibility of operations

Other things we have explored

- Do we support large IO?
- What is an ADB?
- What are Unstable File Creations?
- How does fadvise work?
- Security concerns with Server Side Copy

What haven't we covered?

- LNFS - it has its own meeting
- RPCSEC_GSSv3 - covered in LNFS agenda
- Space reservation - not too much controversy
