Remote LFA

Alternate selection

- 1. Per-Prefix LFA
- 2. Remote LFA with implicit LDP LSP to PQ node
- 3. Remote LFA with explicit RSVP LSP to Q node

rule 3 is optional and happens only if 100%-coverage is desired

Excellent Coverage (rule2)

Confirmed by independent study (Wandl/Verizon at Isocore 2010), or Cariden

- 1. Per-Prefix LFA
- 2. Remote LFA with implicit LDP LSP to PQ node
- 3. Remote LFA with explicit RSVP LSP to Q node

100% Coverage (rule3)

- Rule3
 - Already available via non-automated PQ algorithm in 3 router implementations, under deployment

- 1. Per-Prefix LFA
- 2. Remote LFA with implicit LDP LSP to PQ node
- 3. Remote LFA with explicit RSVP LSP to Q node

Excellent Scale

- Implicit LDP LSP to PQ (rule2) always exist
 - No new LSP required at all

Incremental Deployment

- Keep the LFA properties
 - No protocol change at all
 - Only requires new code at the node where RemoteLFA is enabled
 - Specifically, the PQ node does not require new code

Simple computation

- PQ is per-link not per-prefix
- P set is known once per-prefix LFA is computed
- Q set is a simple dijkstra

Reality

- One router implementation is FCS
- A second one on the line
- Others expected based on deployment discussion
- Confirmed deployment projects
