

A Session Initiation Protocol (SIP) Load Control Event Package

draft-ietf-soc-load-control-event-package-03.txt

Charles Shen, Henning Schulzrinne, Arata Koike

March 2012

Addressed comments received both online and offline since last IETF

- Added state delta support (Sec. 5.1.1, Sec. 7)
- Clarified and consolidated terminology usage (added the second last paragraph in section 1, updated many other places)
- e.g., load control vs. load filtering, load control document vs. overload control document, etc.

Continued

- Updated Filter Distribution (Section 4.3) to make it more readable, especially on some initialization behaviors.
- Clarified that receiving subscription “terminated” message does not mean termination of load control policies themselves. (Sec. 5.8)

- Is this document ready for last call?
